

A world map with a dark blue background, showing the distribution of nighttime lights across the globe. The lights are represented by yellow and orange dots and lines, indicating urban areas and infrastructure. The map is centered on the Atlantic Ocean, with North and South America on the left and Europe, Africa, and Asia on the right.

Deriving the distribution of population from nighttime lights data

- Questions

Finding the best correlation

- Comparison regression types

Population estimation

- Method 1 using NTL intensity
- Method 2 using NTL density

Nighttime light density

$$\lambda = L / A$$

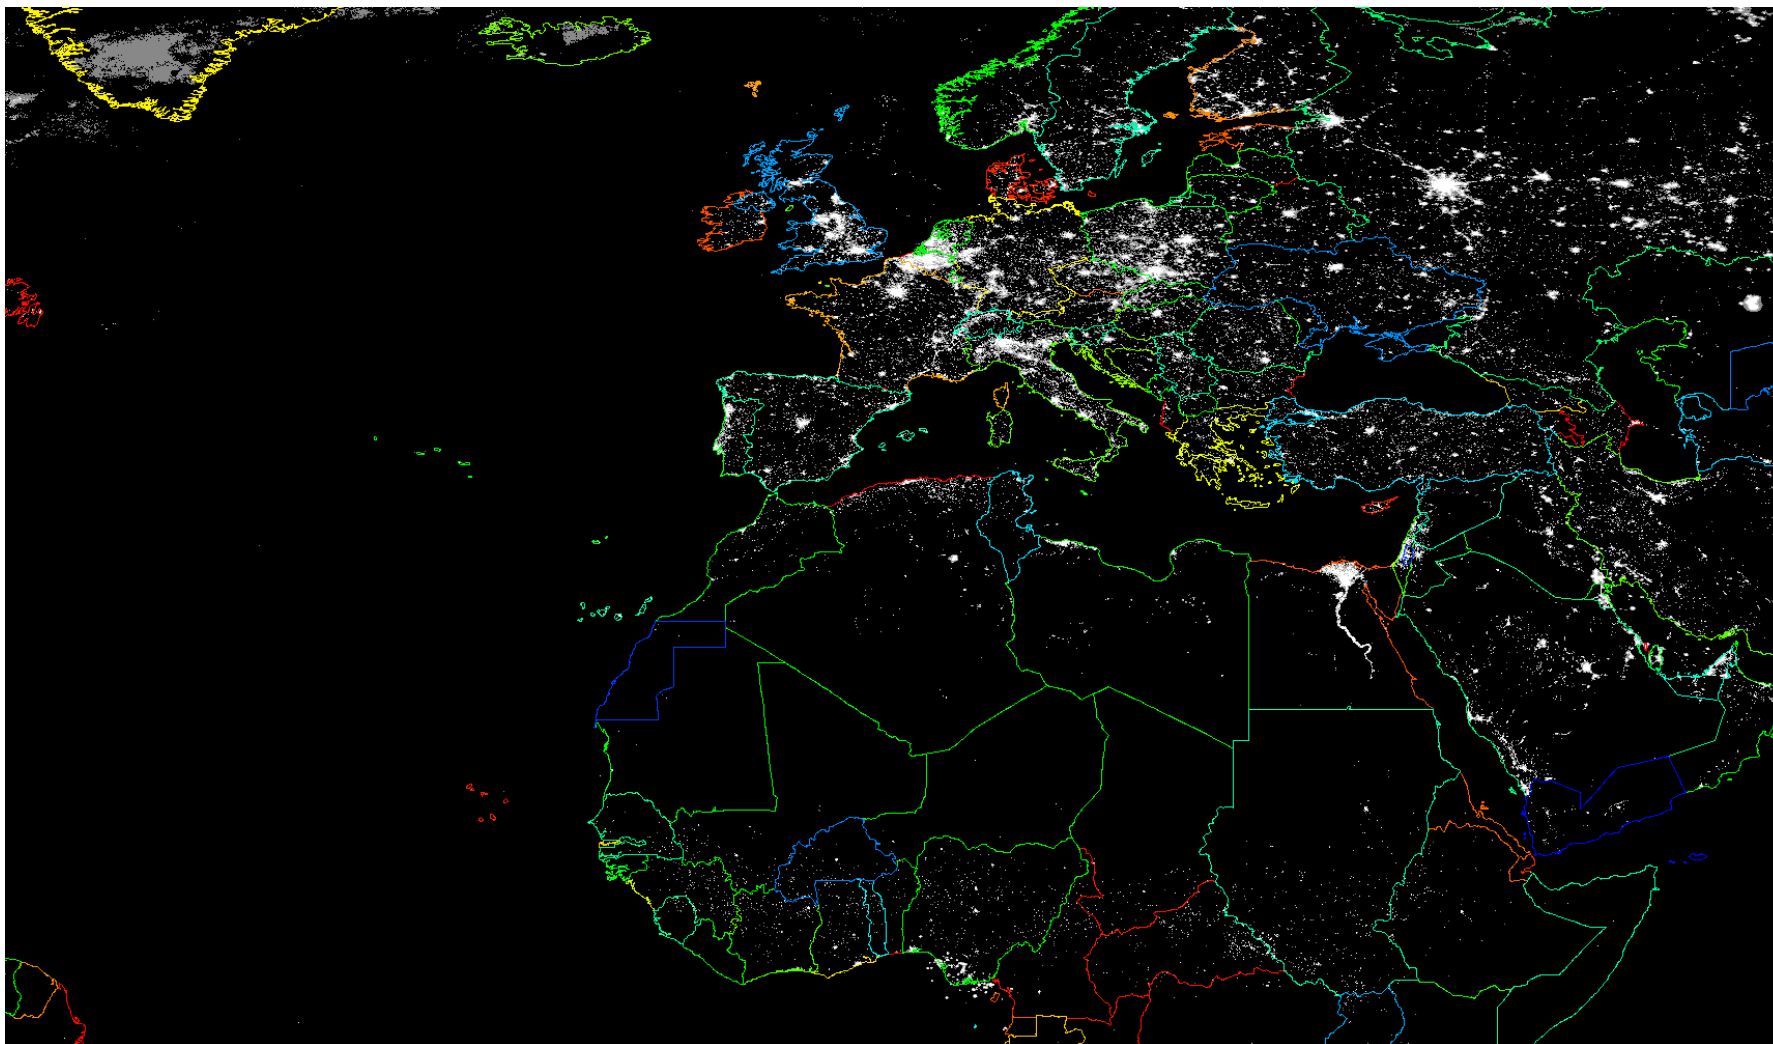

where,

λ - nighttime light density, nano Watts/(cm² * sr * km²),

L - nighttime light intensity, nano Watts/(cm² * sr),

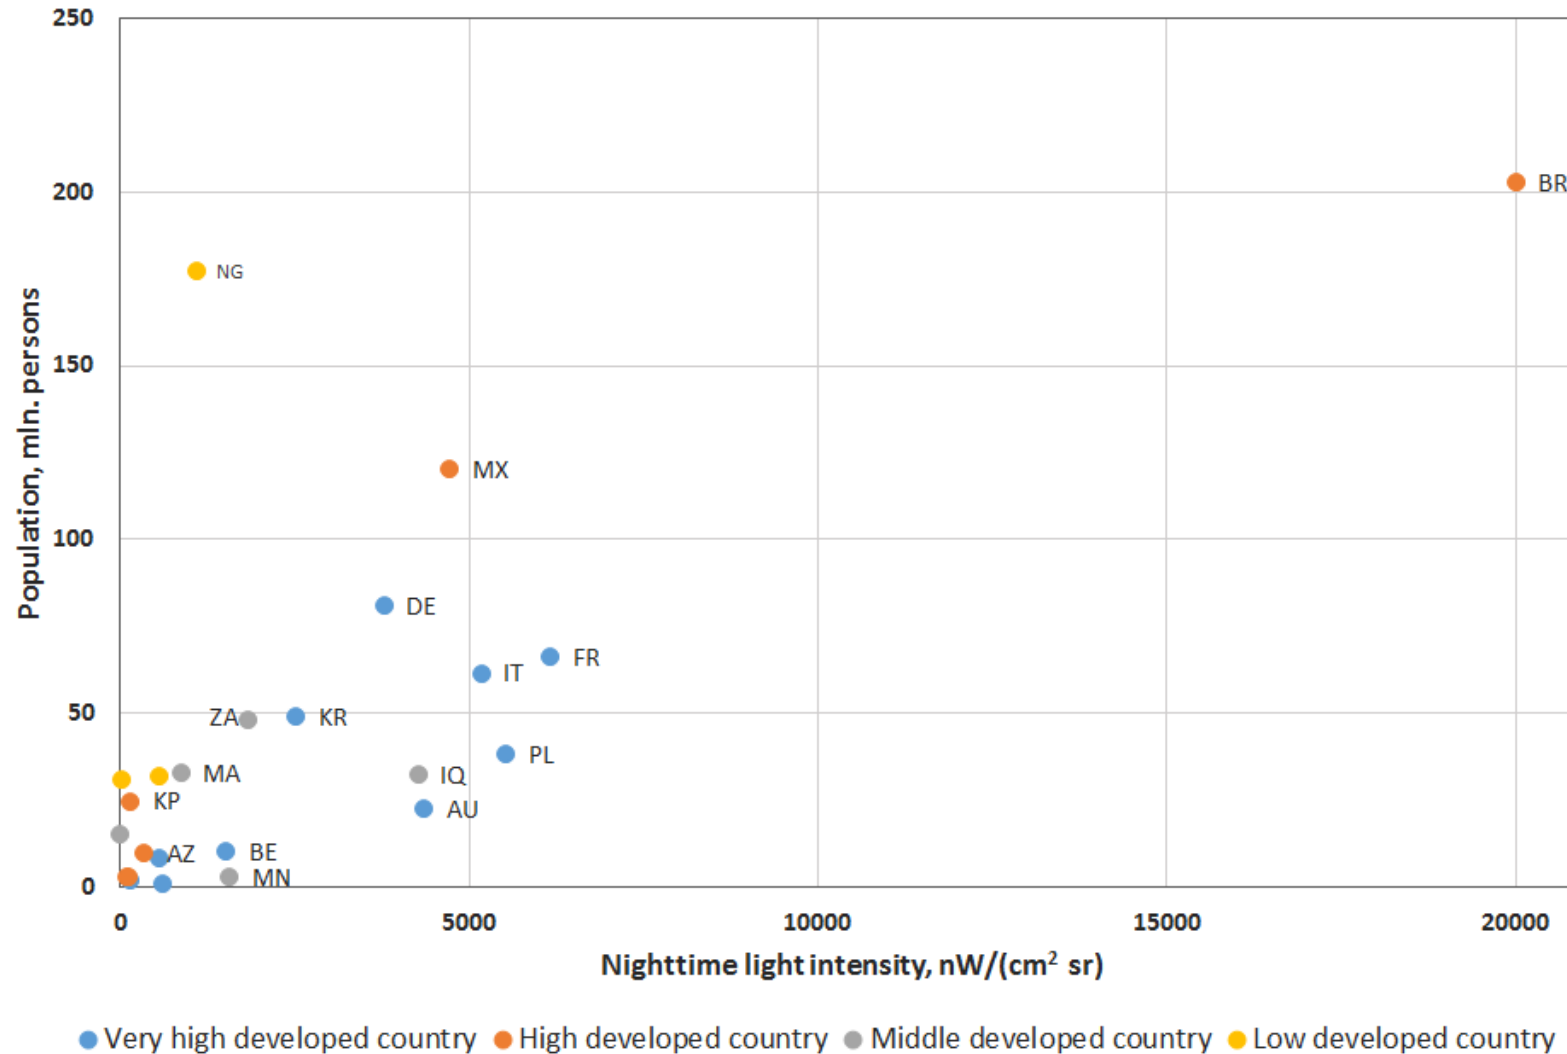

A - area of an administrative unit, km²

Tile 2 with country borders

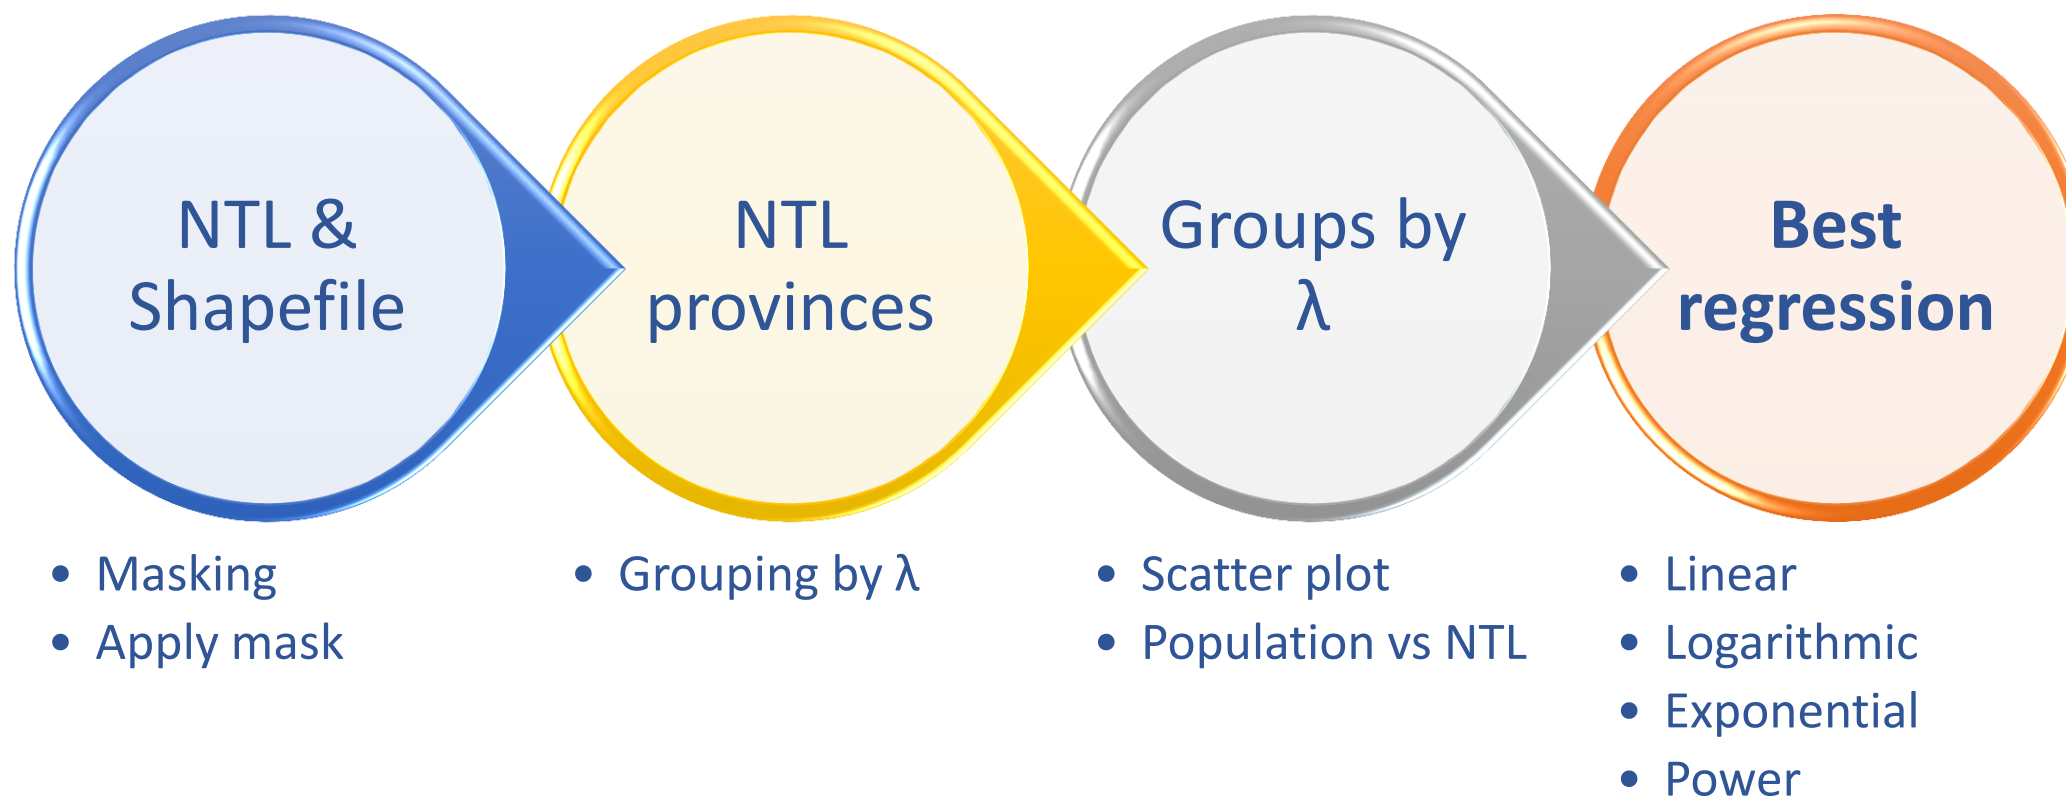

Source: NOAA/NGDC Nighttime lights image, ESRI shapefile

NTL versus Population

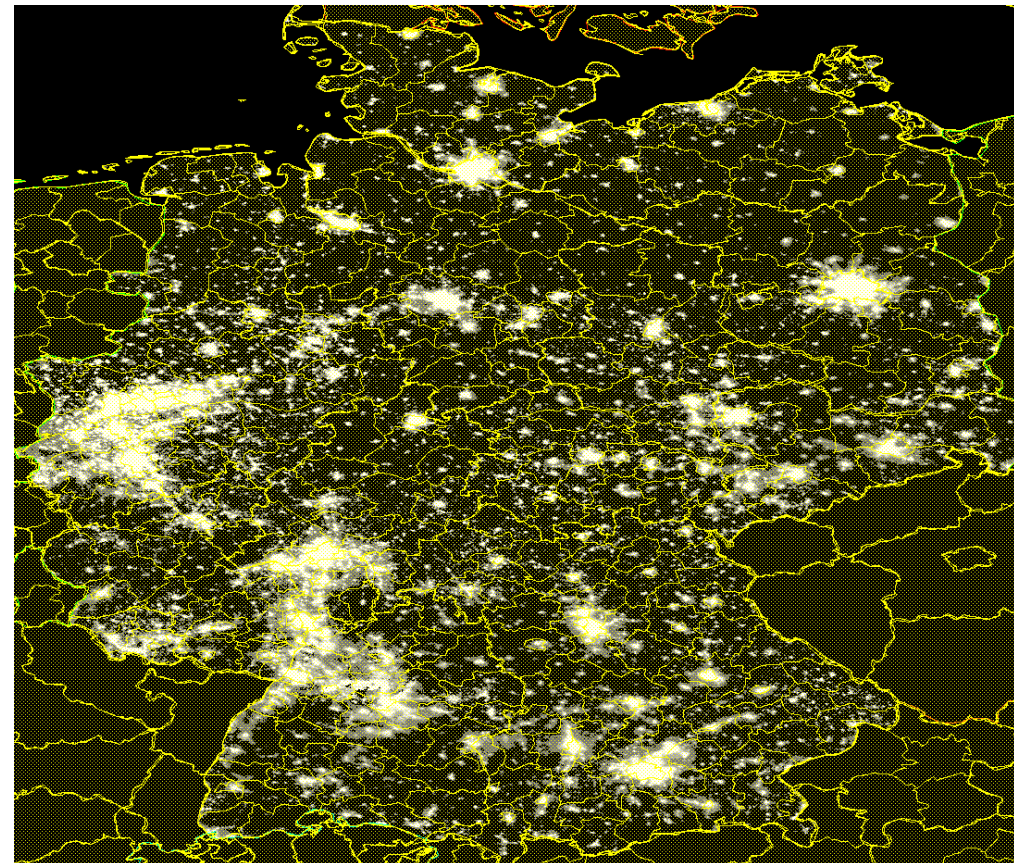

Finding the best correlation

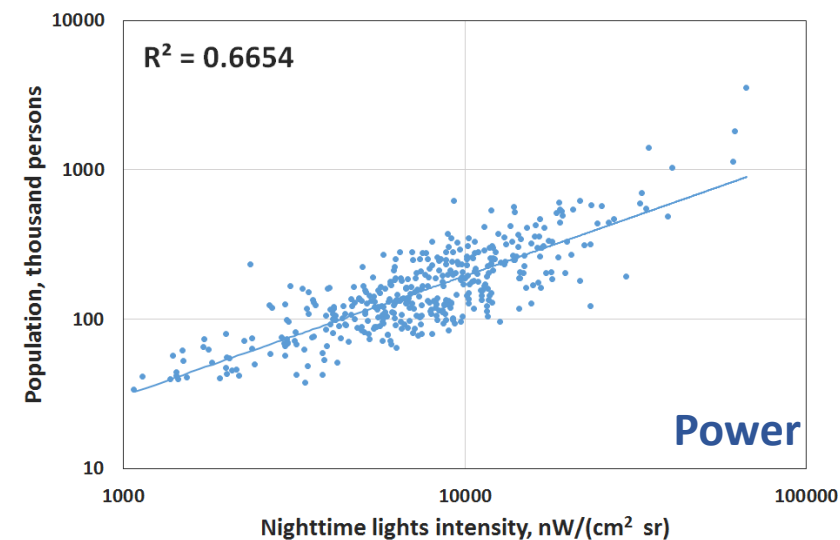

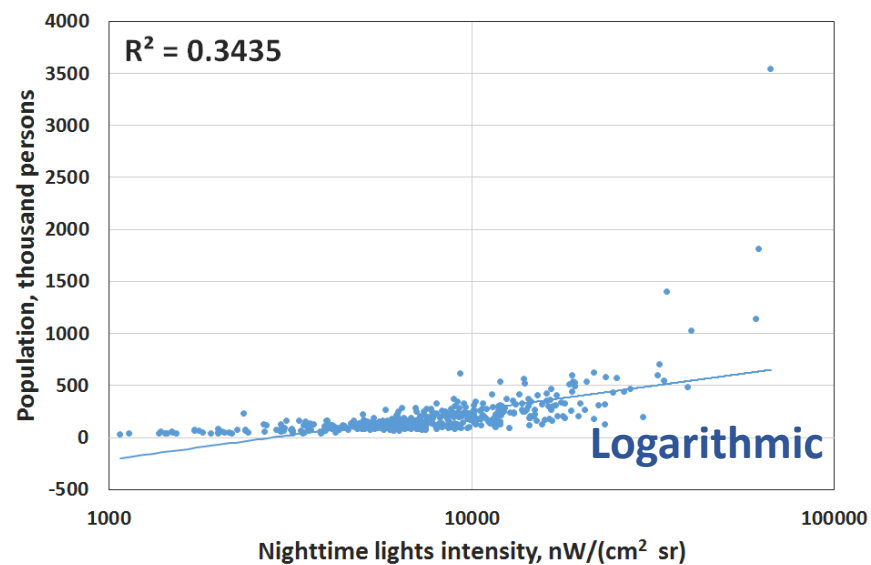

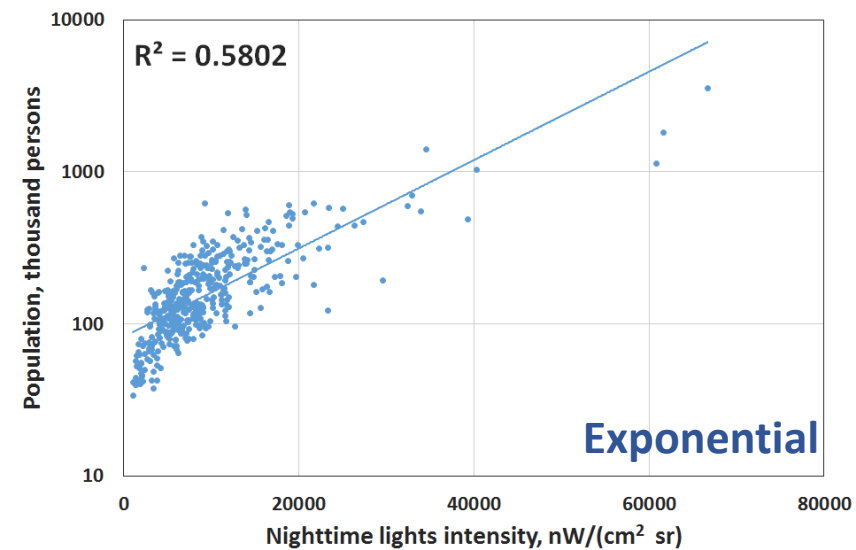

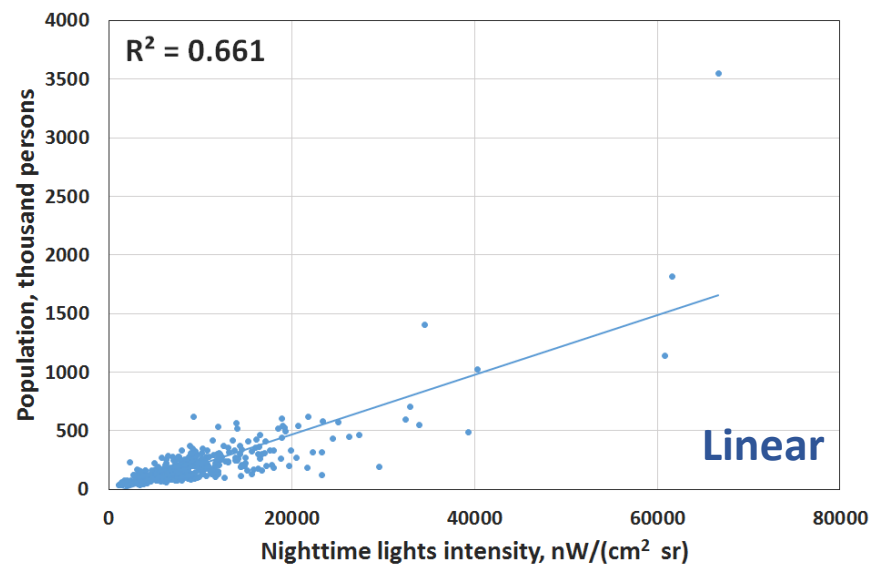

Nighttime lights of Germany

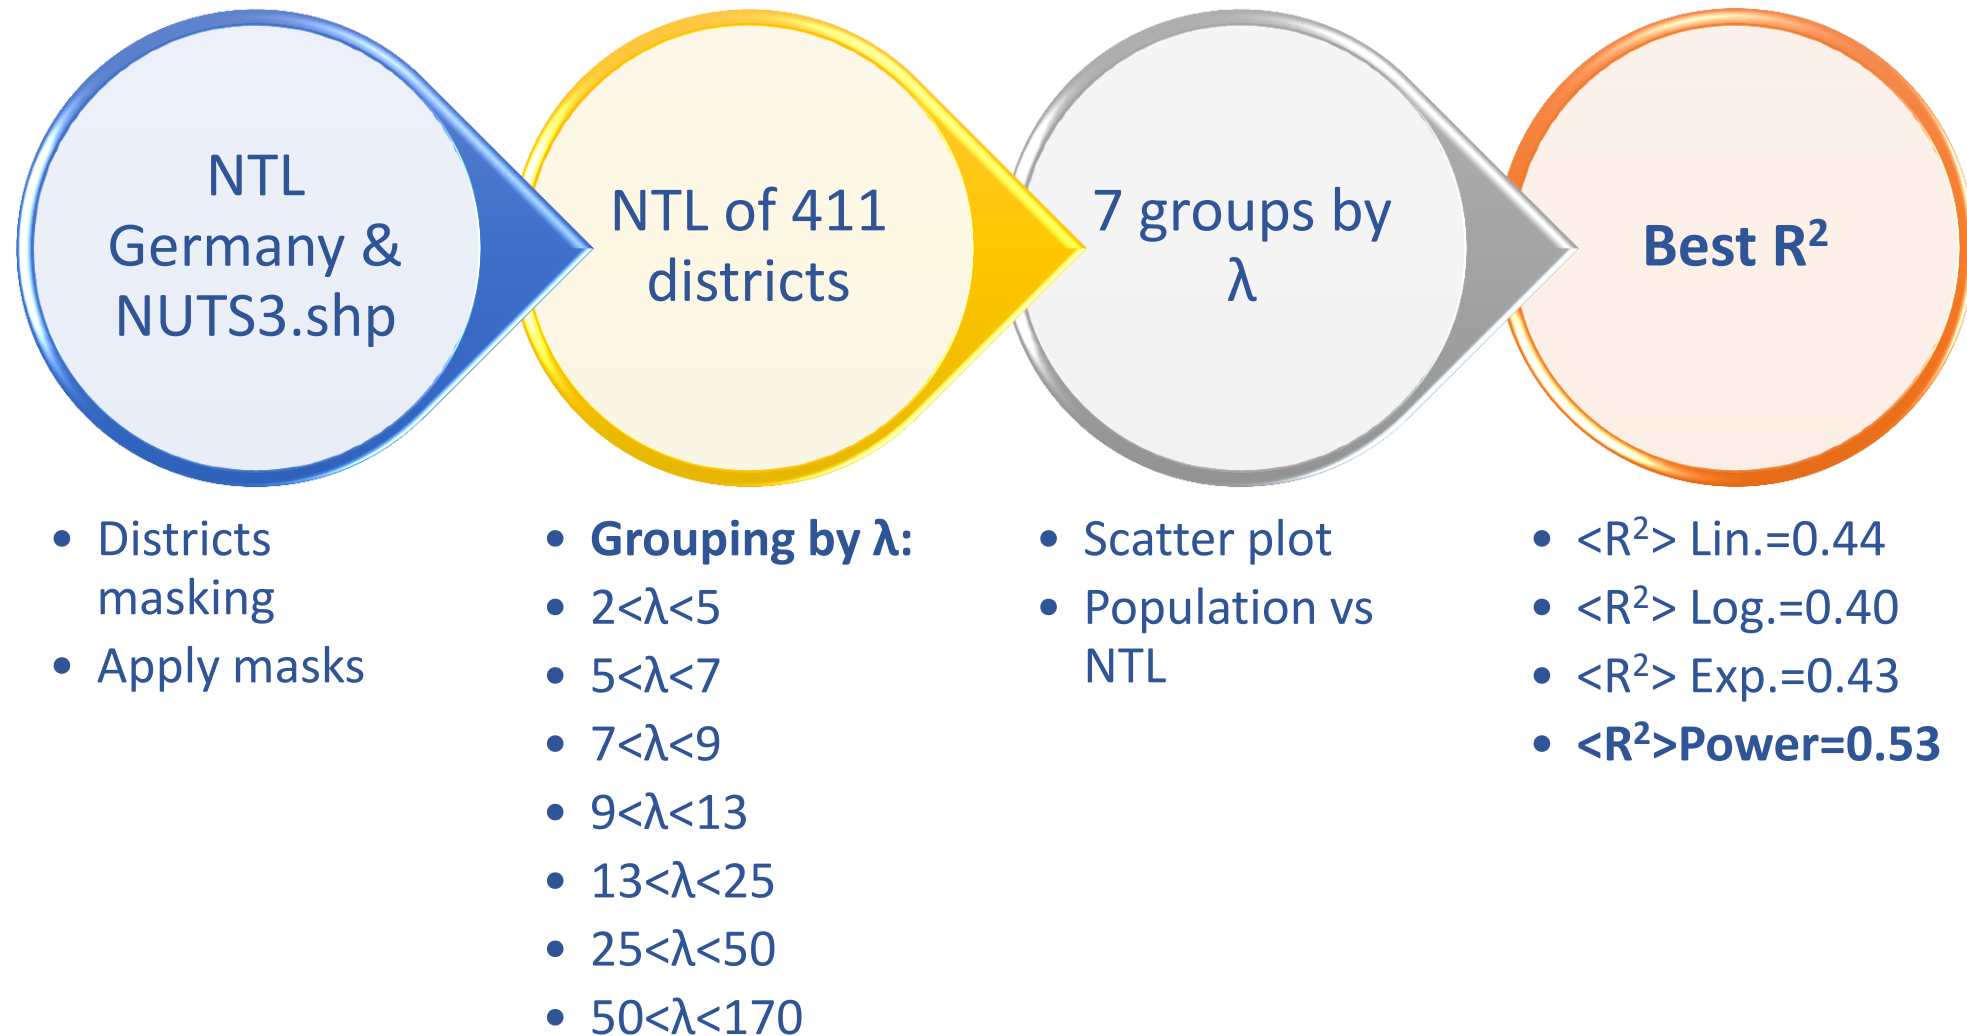

District (NUTS3) borders of Germany

Source: NOAA/NGDC Nighttime lights image, naturalearthdata shapefile

Comparing regression types

Correlation coefficients of compared regressions

λ range	Average λ	R^2 linear	R^2 logarithmic	R^2 exponential	R^2 power
2-170		0.66	0.34	0.58	0.67
2-5	3.5	0.12	0.13	0.13	0.15
5-7	6	0.25	0.28	0.29	0.34
7-9	8	0.32	0.35	0.34	0.38
9-13	11	0.44	0.41	0.45	0.48
13-25	19	0.37	0.43	0.44	0.65
25-50	37.5	0.82	0.72	0.60	0.84
50-170	110	0.77	0.51	0.78	0.87

Population estimation

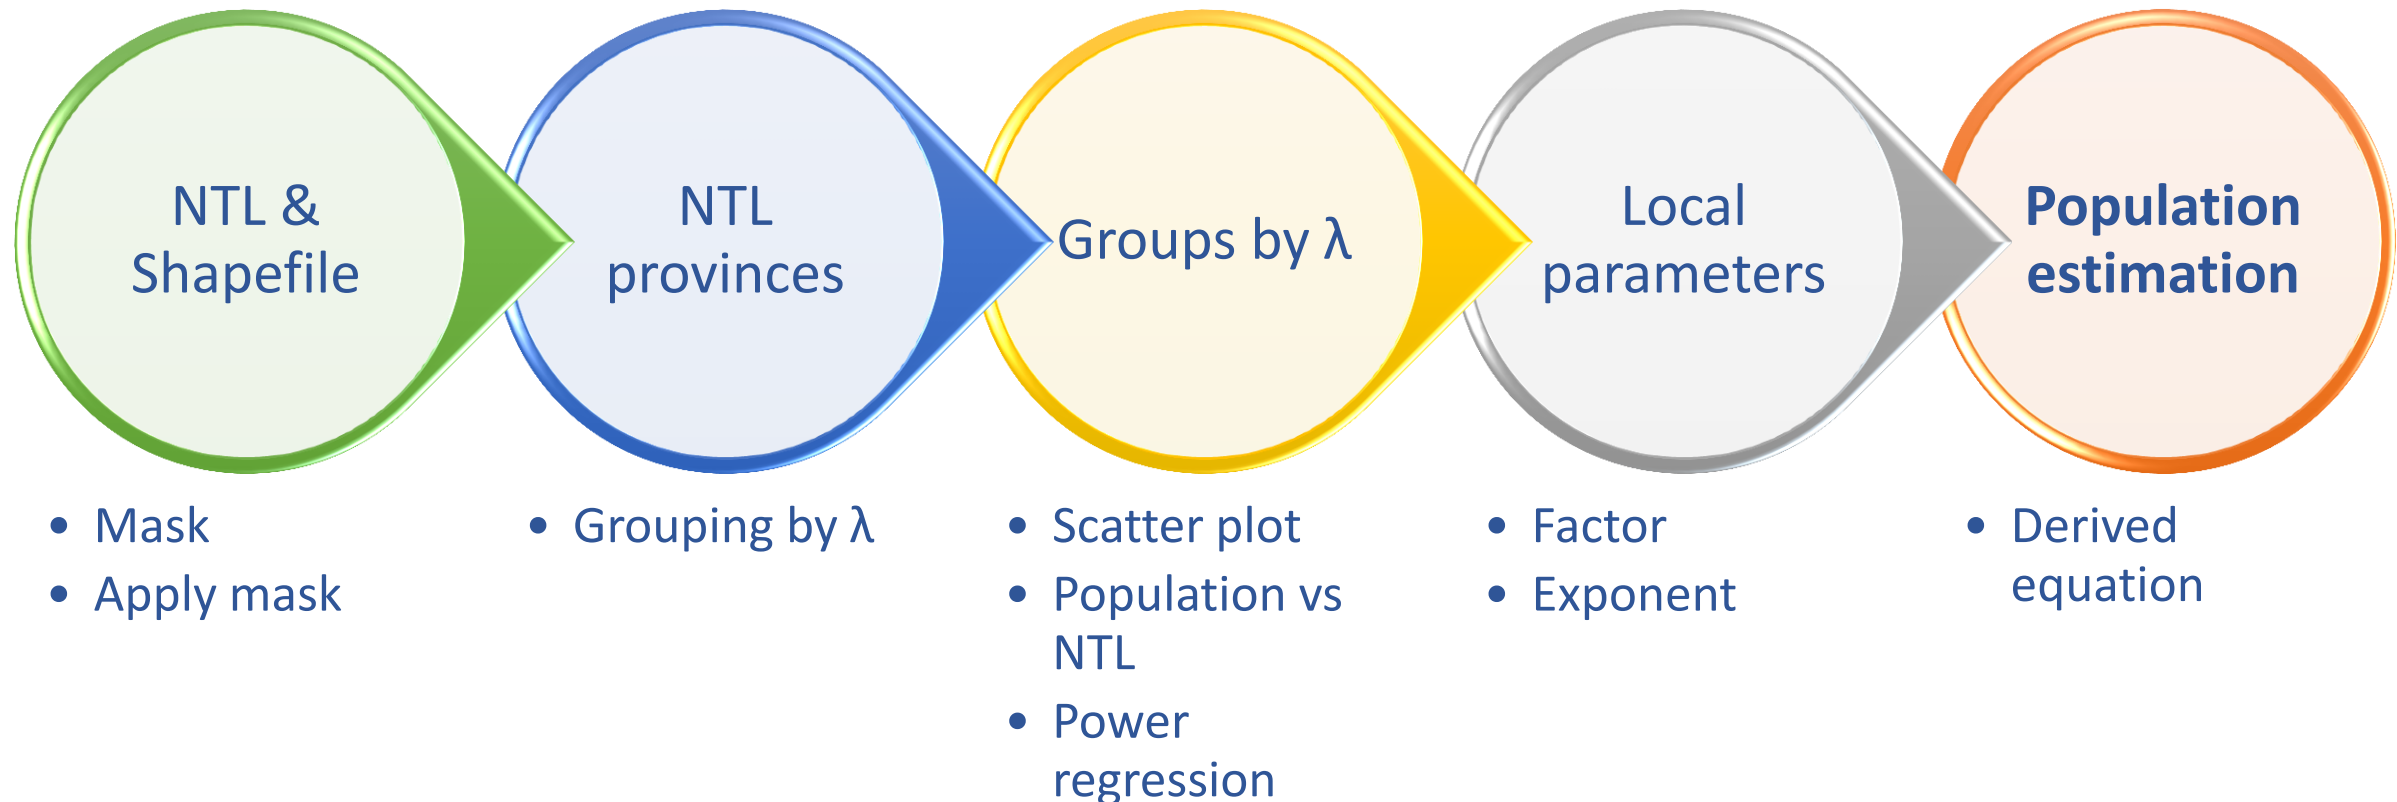

Method 1

- Population estimation using NTL **intensity**

Method 2

- Population estimation using NTL **density**

Deriving the population distribution

Population estimation by method 1

$$f = f(a) * \lambda^{e(a)}$$

$$e = f(b) * \lambda^{e(b)}$$

$$P_e = f * L^e$$

where,

P_e – estimated population

λ - nighttime light density

L - nighttime light intensity

f – factor

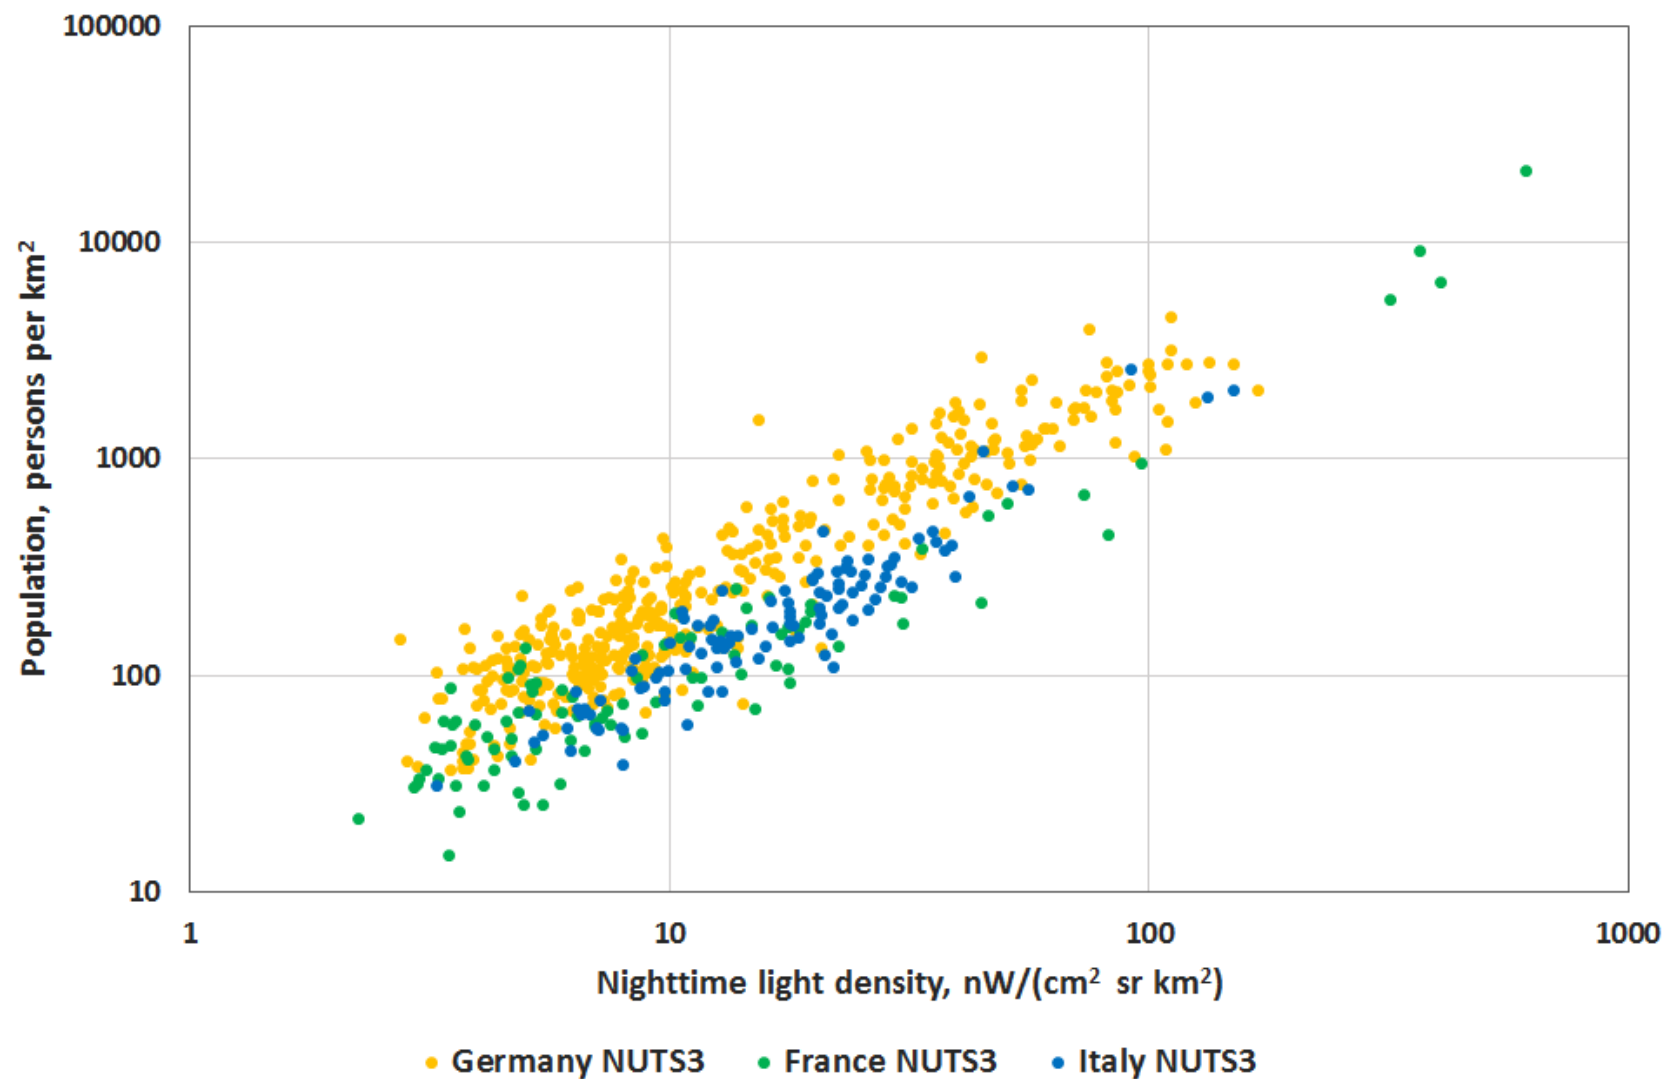

$f(a)$ – factor to calculate f

$e(a)$ – exponent to calculate f

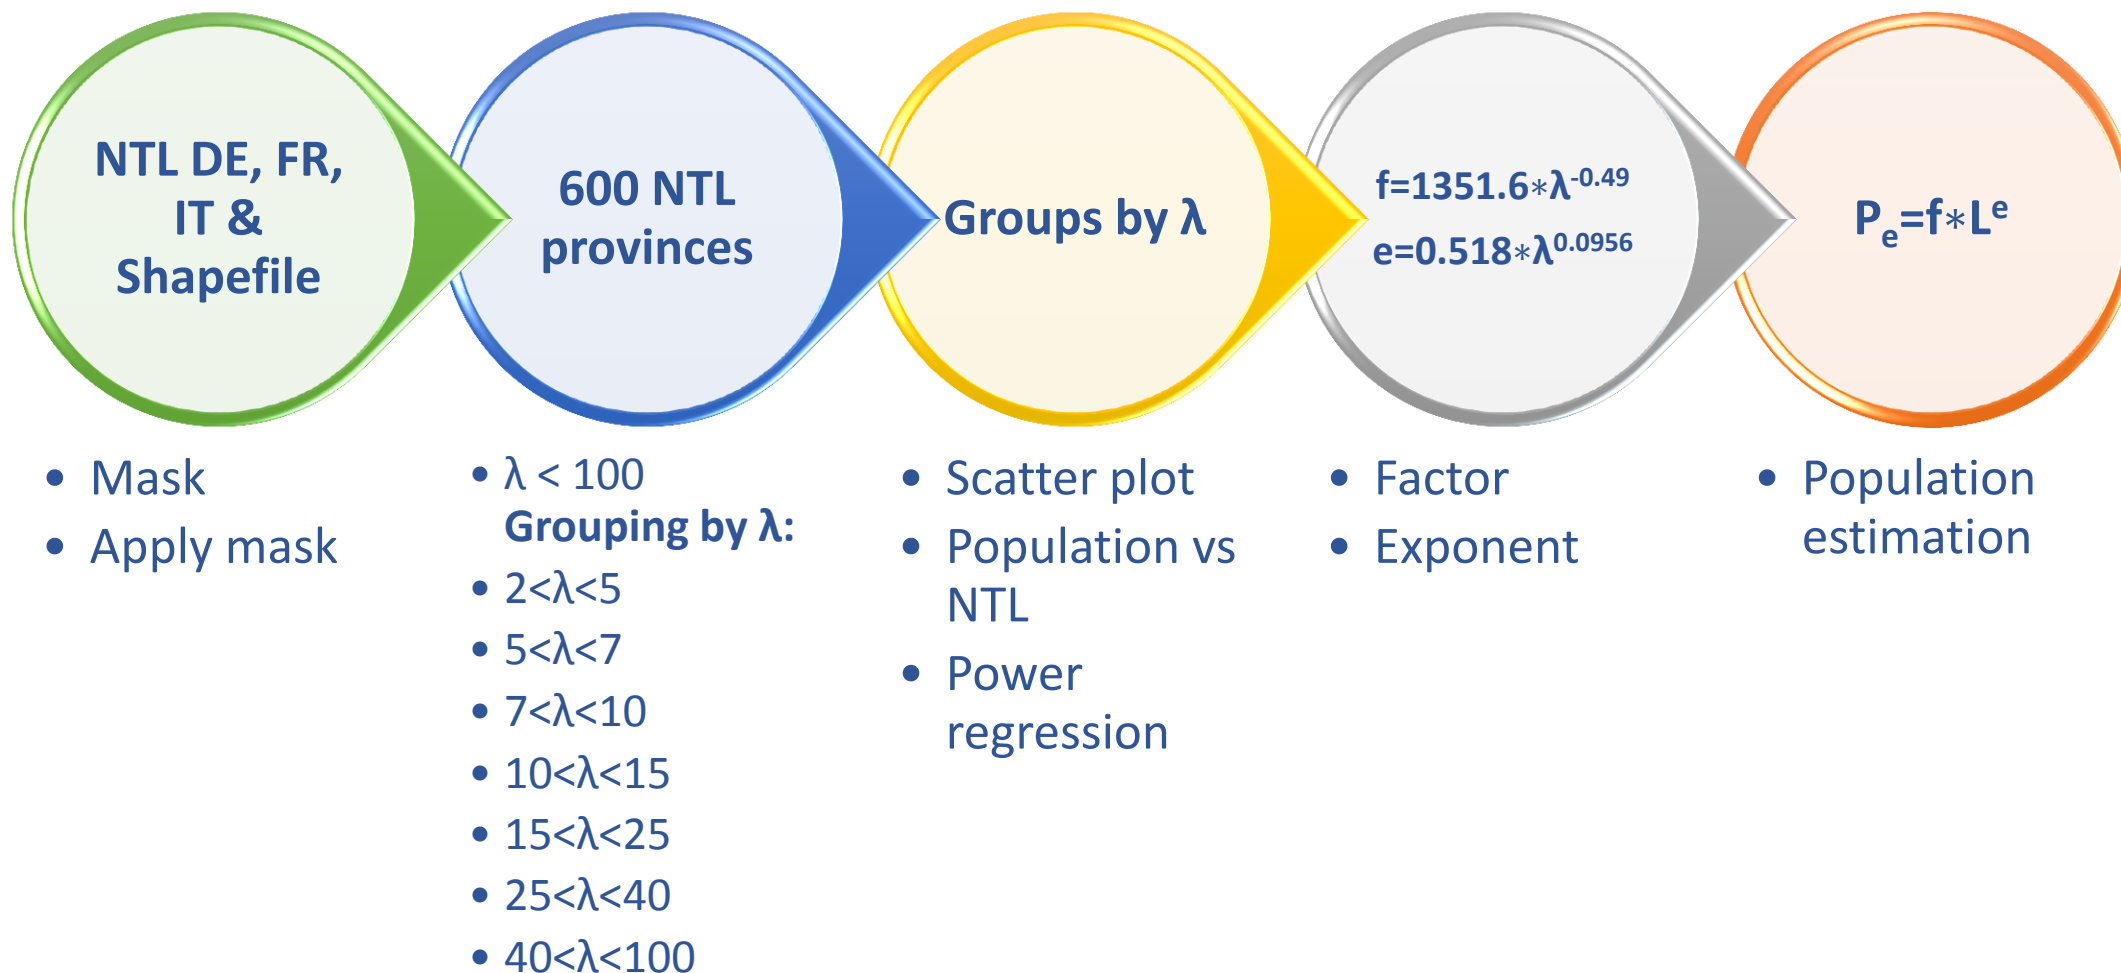

e – exponent

$f(b)$ – factor to calculate e

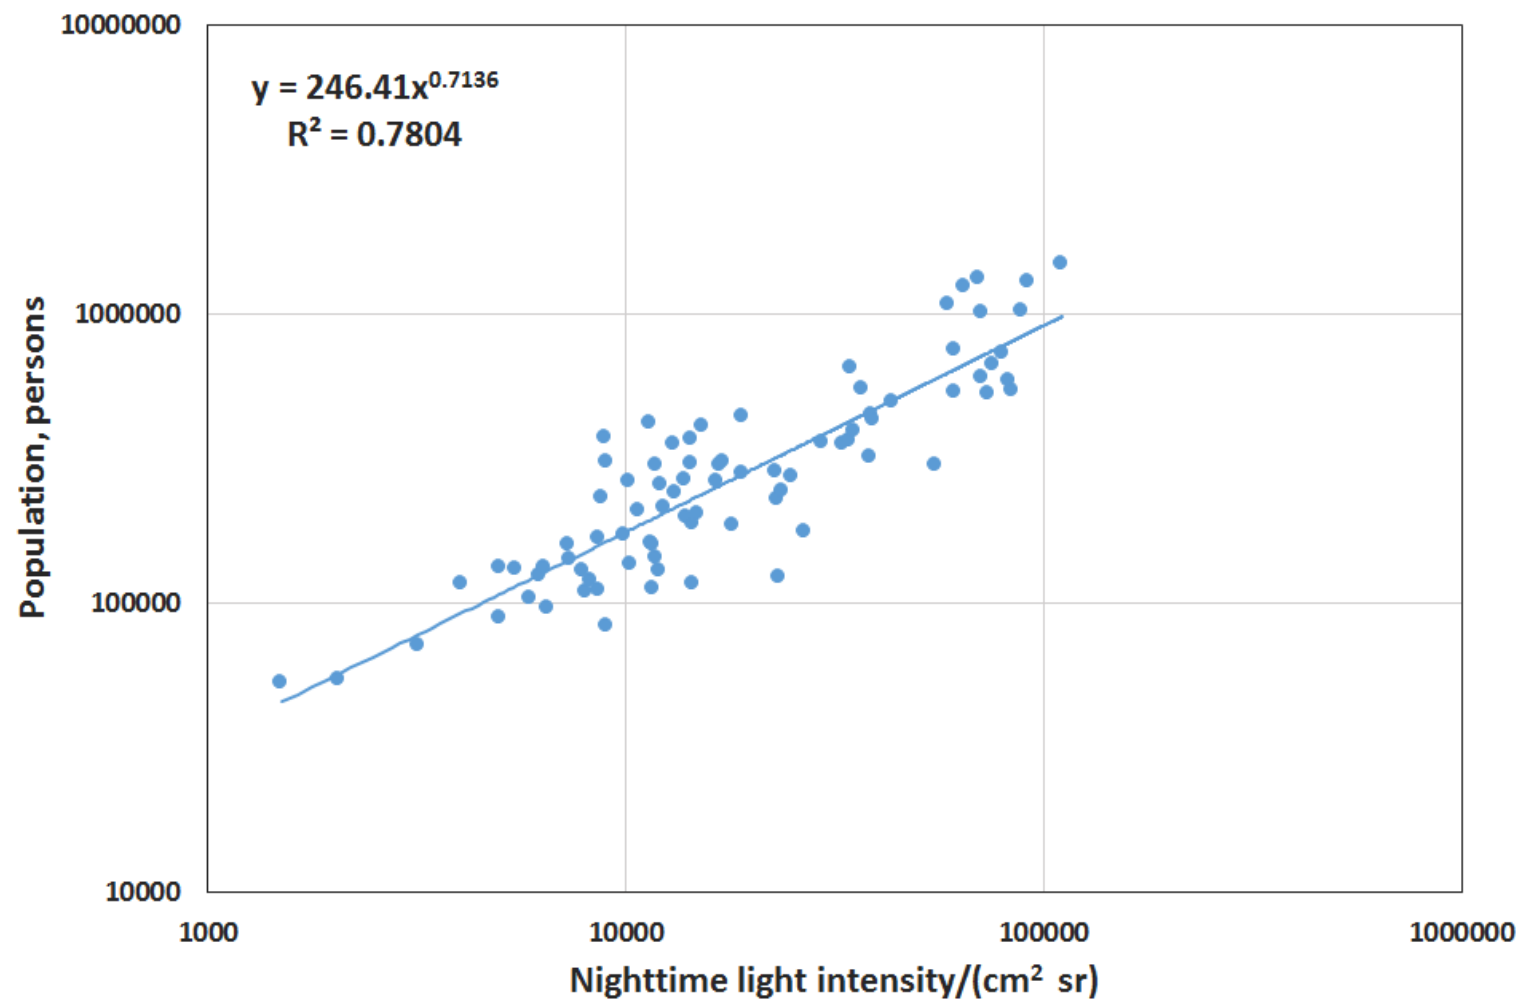

$e(b)$ – exponent to calculate e

Method 1 using NTL intensity

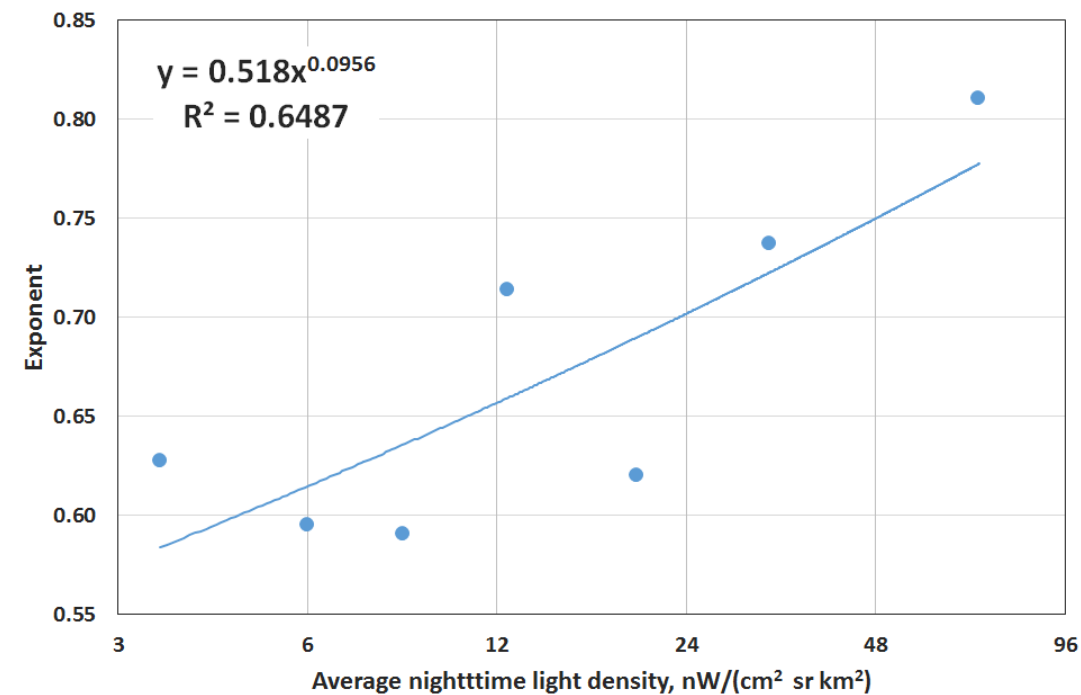

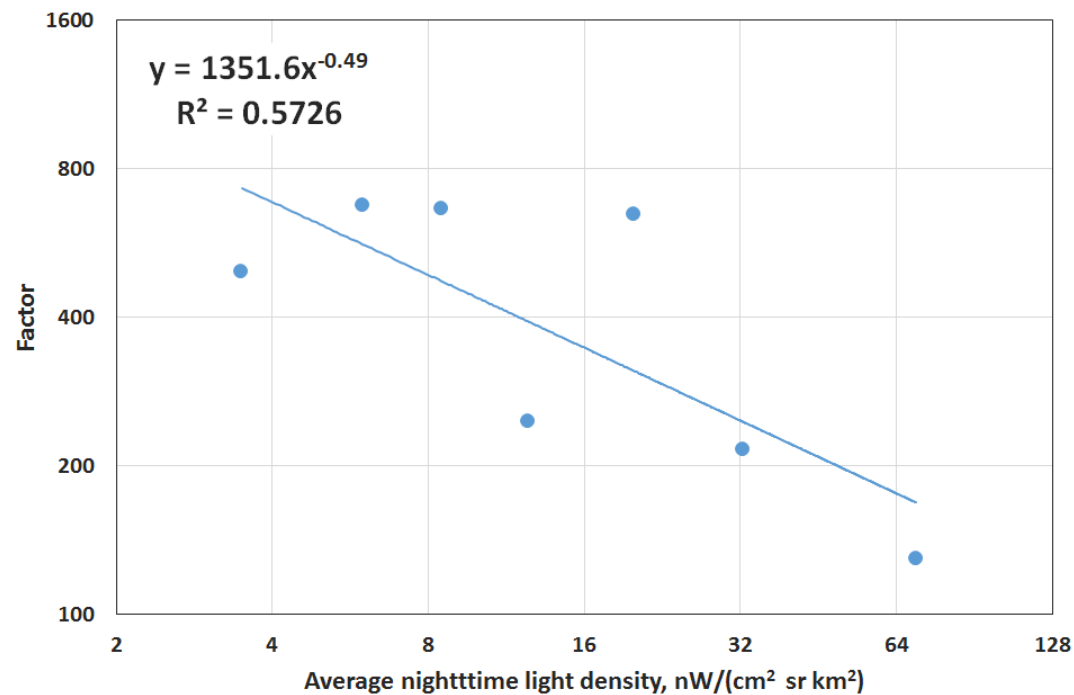

Example of extracting a factor and an exponent values from group $10 < \lambda < 15$

All extracted factors and exponents values

average λ of a group	3.5	6	8.5	12.5	20	32.5	70
factor	494.4	673.63	663.19	246.41	645.89	215.78	129.33
exponent	0.6277	0.5953	0.5906	0.7136	0.6201	0.7371	0.8103

Deriving a factor and an exponent by method 1

Population estimation by method 1

$$f = 1351.6 * \lambda^{-0.49}$$

$$e = 0.518 * \lambda^{0.0956}$$

$$P_e = f * L^e$$

where,

P_e – estimated population

λ - nighttime light density

L - nighttime light intensity

f – factor

$f(a)$ – factor to calculate f

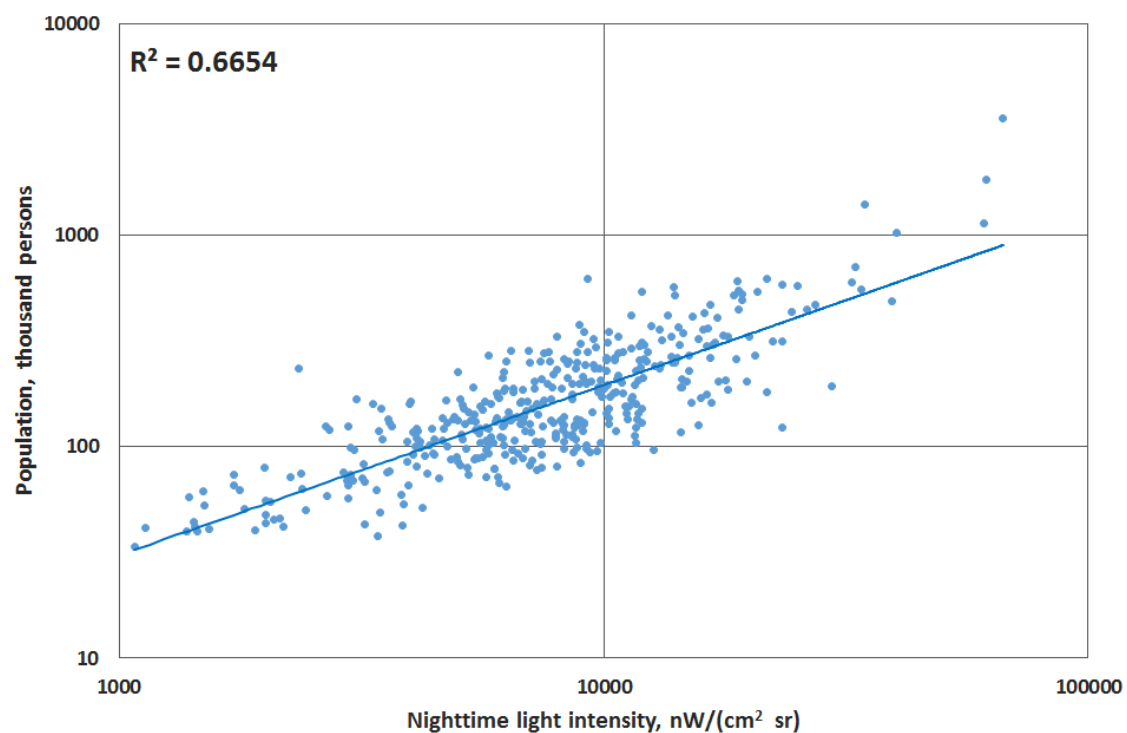

$e(a)$ – exponent to calculate f

e – exponent

$f(b)$ – factor to calculate e

$e(b)$ – exponent to calculate e

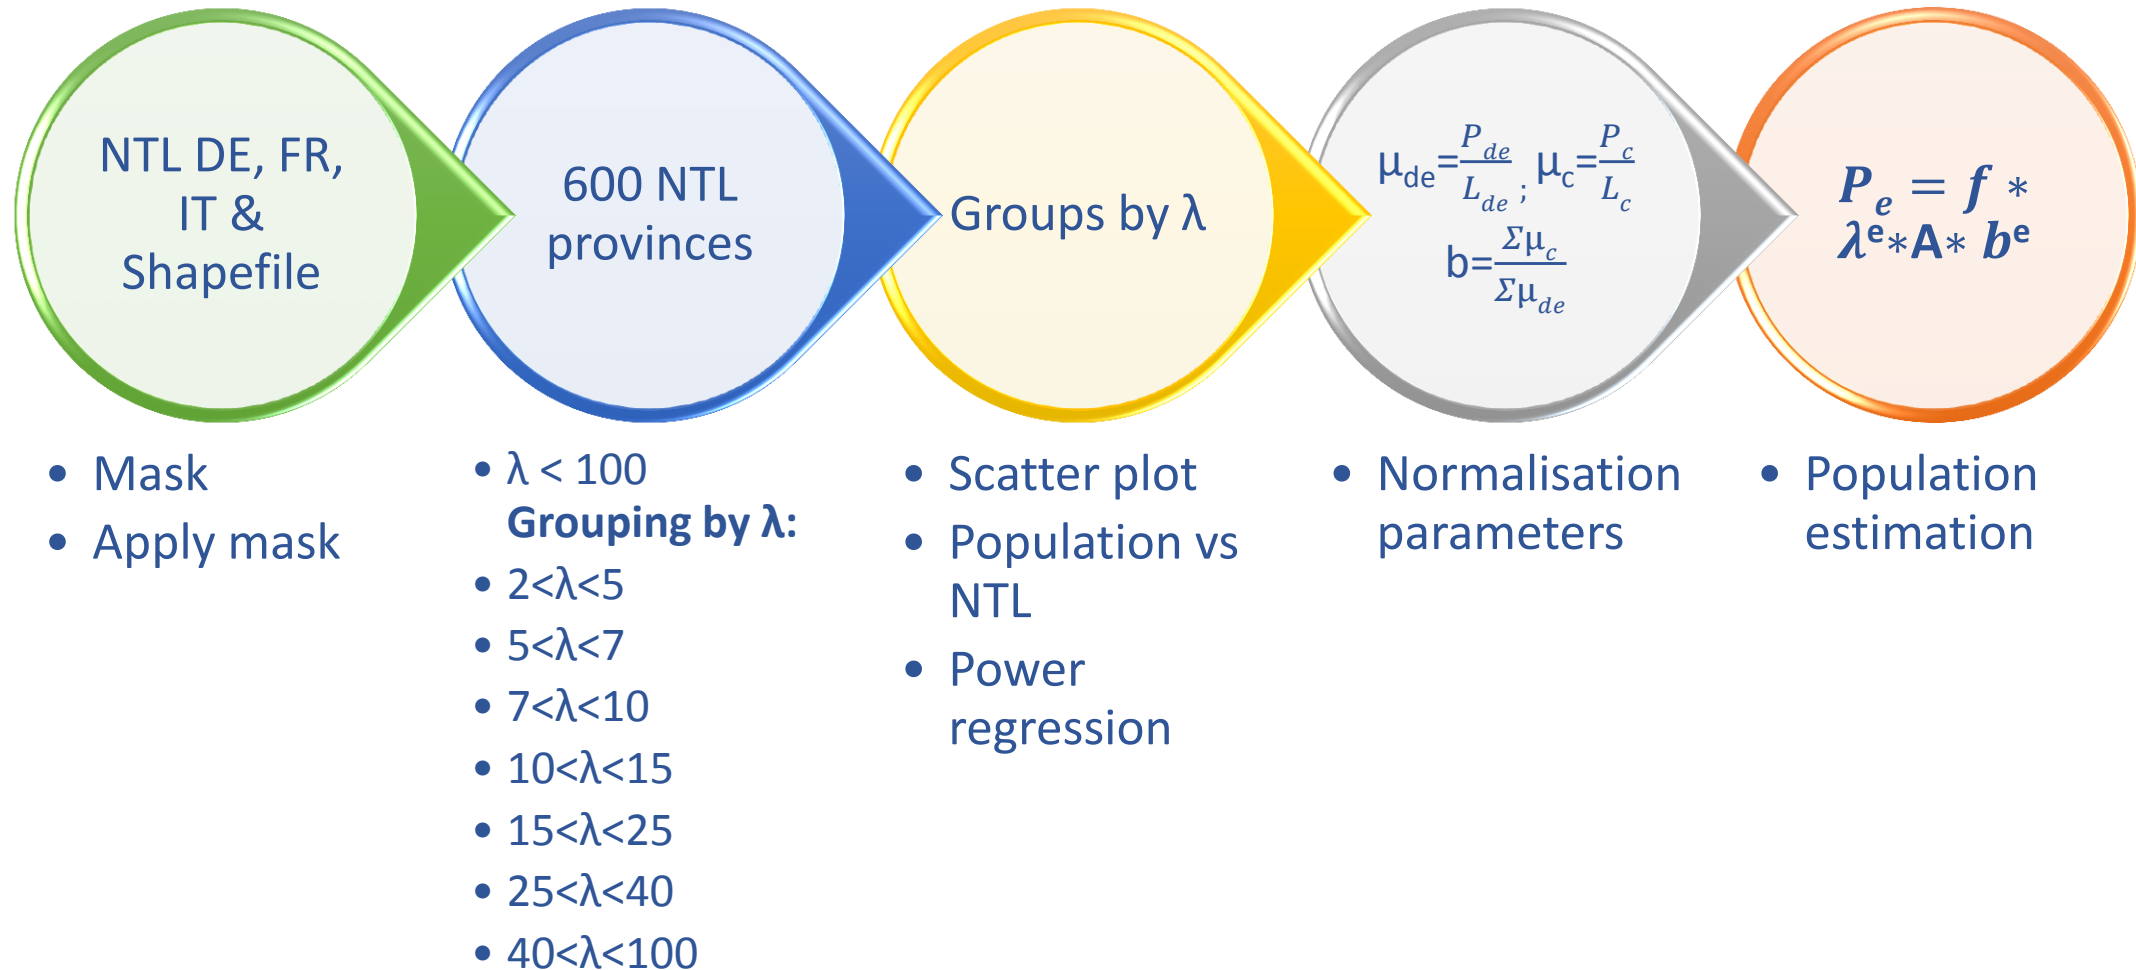

NTL intensity vs. Population

NTL density vs. Population density

Method 2 using NTL density

Population estimation by method 2

$$\mu_{de} = \frac{P_{de}}{L_{de}}$$
$$\mu_c = \frac{P_c}{L_c}$$

$$b = \frac{\sum \mu_c}{\sum \mu_{de}}$$

$$P_e = f * \lambda^e * A * b^e$$

where,

P_e – estimated population

P_c – country population

P_{de} – Germany population

λ - nighttime light density

L - nighttime light intensity

f – factor

e – exponent

Agenda

Agenda

- Introduction
- Data description
- Existing work
- Methods
- Experiments
- Results
- **Discussion**
- Conclusion and Outlook
- Questions

Discussion

- General restrictions: gas flares, wildfires, auroras
- Method 1 restrictions: valid for European countries with evenly distributed population
- Negative values on VIIRS DNB: consequence of calibration

Agenda

- Introduction
- Data description
- Methods & Experiments
- Results
- Discussion
- **Conclusion and Outlook**
- Questions

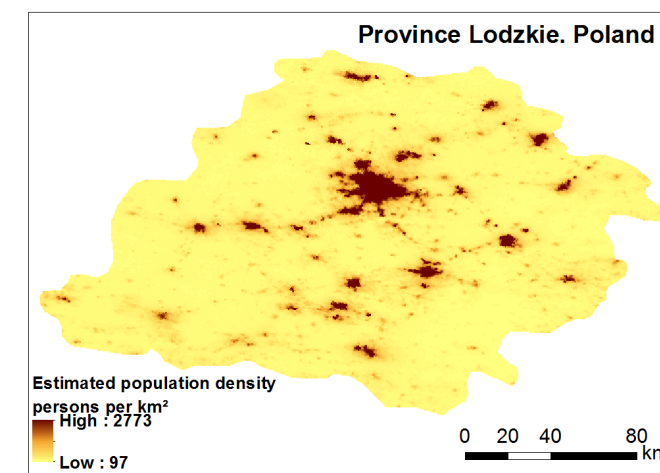

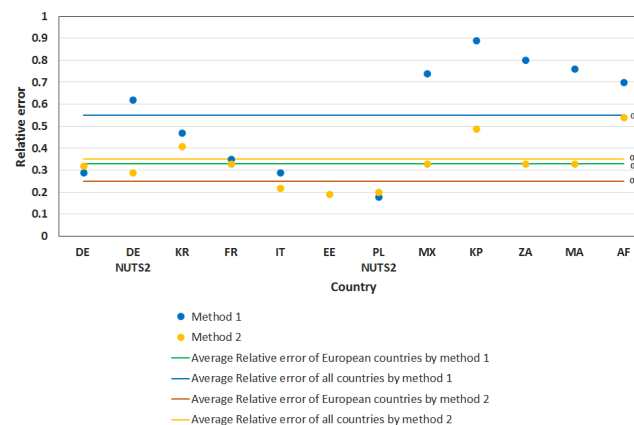

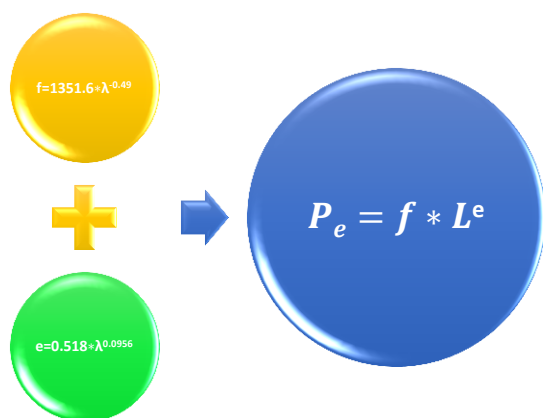

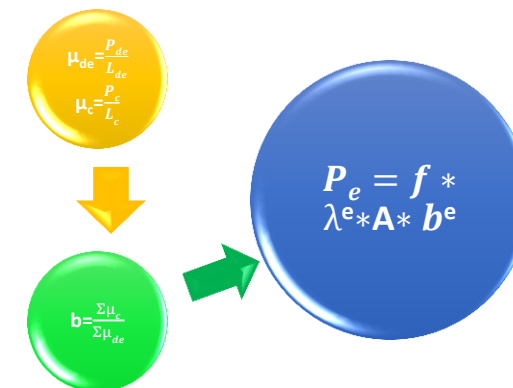

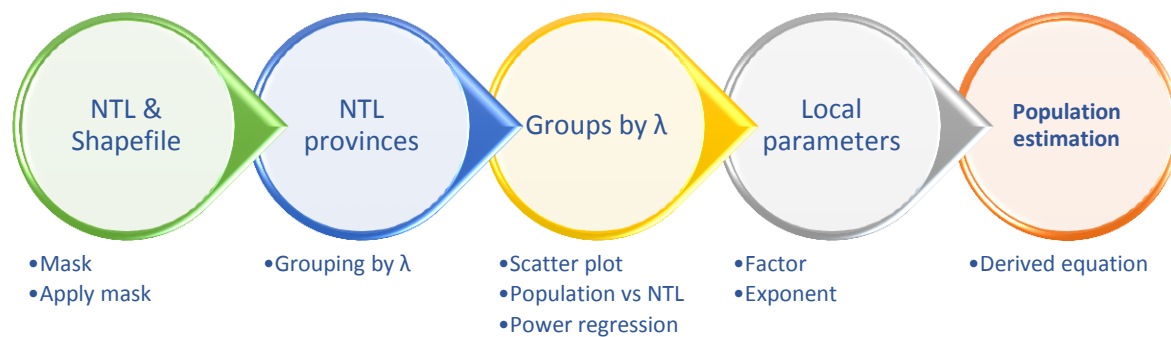

Conclusion

- **Power law** is the best among regression types
- Relationship of **NTL density and Population density** is stronger than NTL intensity to Population
- **Method 2** ($\epsilon_{\text{all}}=0.33$; $\epsilon_{\text{eu}}=0.25$) using NTL density is much better than Method 1 ($\epsilon_{\text{all}}=0.55$; $\epsilon_{\text{eu}}=0.35$)

Outlook

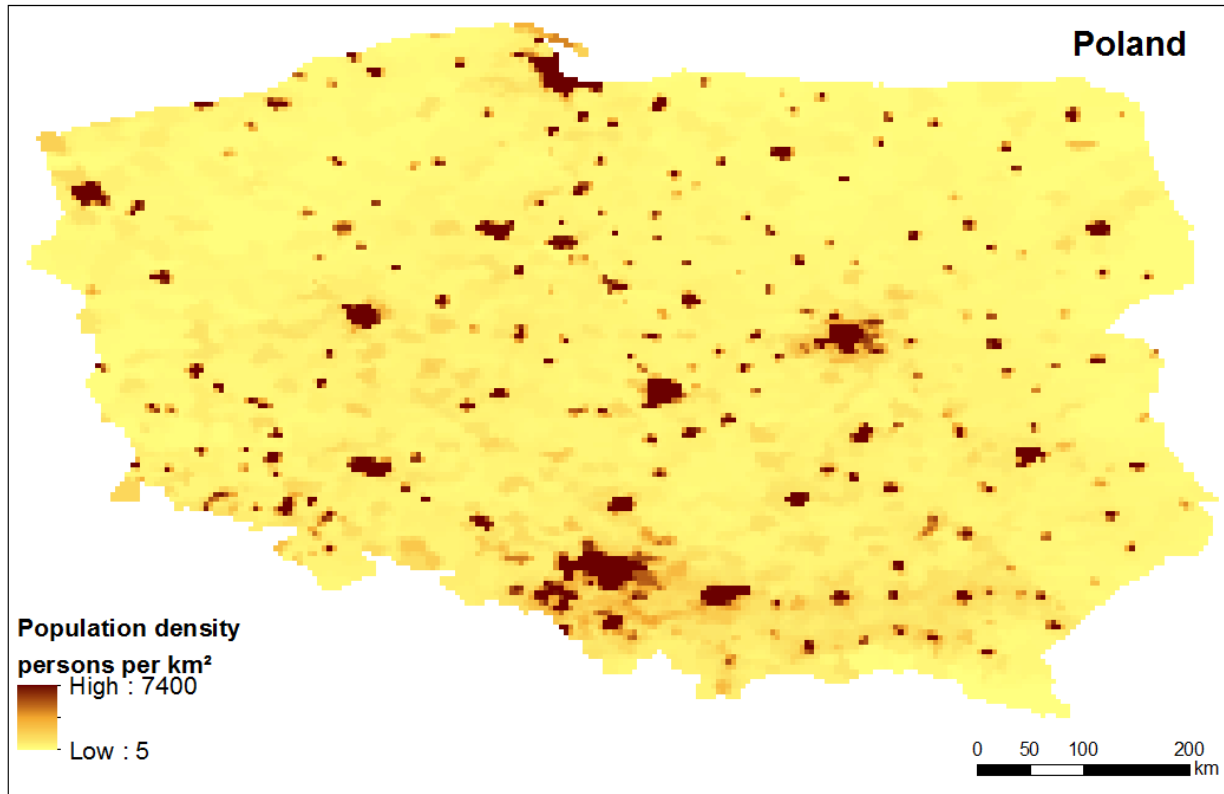

- Removing noise
- Using land cover
- Several year time lapse
