

# OBJECT-BASED CLASSIFICATION FOR ESTIMATION OF BUILT-UP DENSITY WITHIN URBAN ENVIRONMENT

*Master thesis defence*

*Author: Juraj Murcko, MSc. Cartography*

*Supervisors:*

*Prof.Dr.habil. Elmar Csaplovics*

*Dr. Mustafa Mahmoud El-Abbas*

*Consultant: Mgr. Tomáš Bartaloš (GISAT s.r.o.)*

# Agenda

- ⦿ Introduction
- ⦿ Background
- ⦿ Thesis objective
- ⦿ Data, study area, pre-processing
- ⦿ Process (Rule Set) development
- ⦿ Results, discussion
- ⦿ Conclusion

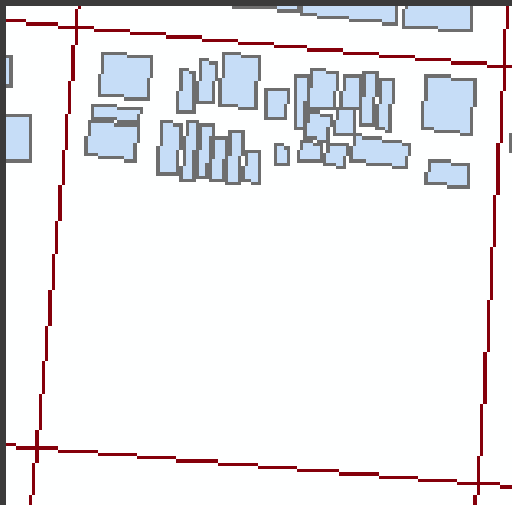

# Introduction

- ⦿ Remote Sensing data – important source of information for studying urban environments
- ⦿ Satellite, aerial imagery
- ⦿ Image analysis
- ⦿ Classification, land use / land cover (LULC)
- ⦿ Quantitative (e.g. vegetation) analysis, spectral indices, hyperspectral analysis
- ⦿ Spatial indicators, land statistics (e.g. greenness, imperviousness, built-up density)
- ⦿ Spatial data extraction (image classification, OBIA)

# Background

- ◎ **Built-up density:** proportion of built-up surface on the total surface of an area
  - Indicator of urban growth
  - Often related to population density
  - Can be calculated on a regular grid, administrative units, parcels, other area units
  - 1 value - not representative, if the area is not homogeneous

## Various spatial distribution of built-up structures within an area unit (road enclosed segments)

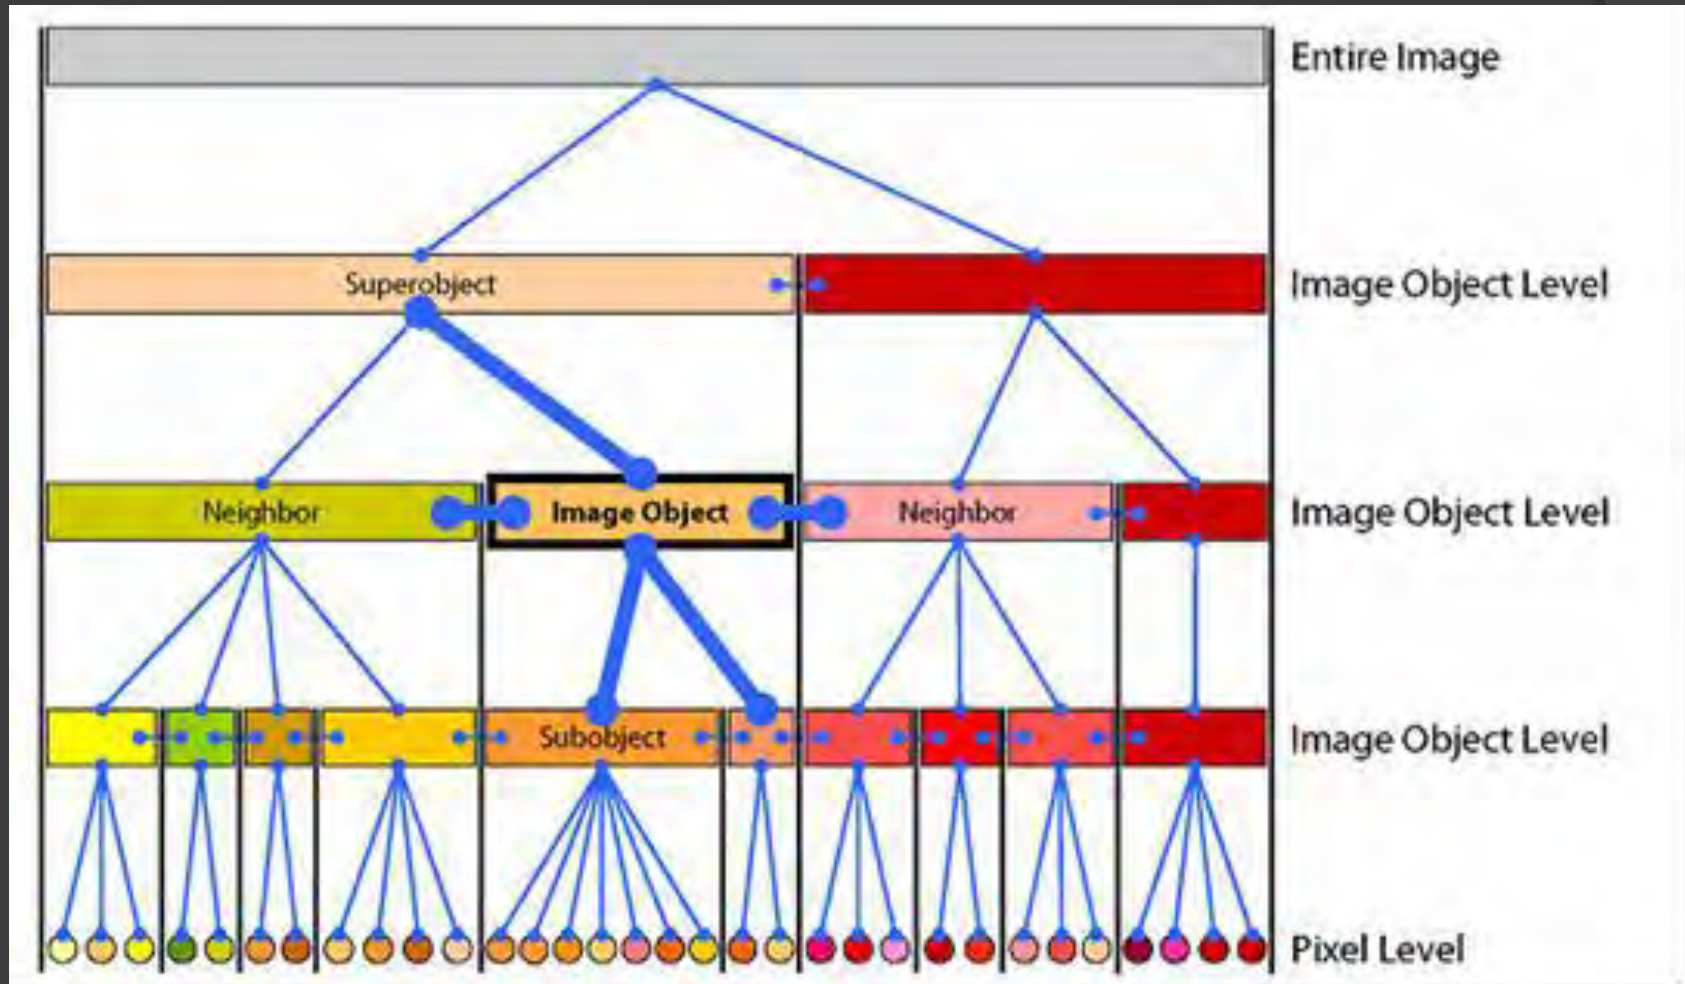

# Master Thesis Objective

- ④ **To develop, implement and describe a semi-automated object-based image classification approach** for mapping built-up areas from VHR imagery and **classification of built-up density** within blocks of broader built-up areas that are homogeneous in their urban fabric.
- ④ These blocks **are not a priori defined**, but instead should be **created** based on the remote sensing image data itself.

# Object-based Image Analysis

- ◎ OBIA – object-based image analysis
  - Image segmentation + image analysis + image classification
- ◎ Analysis of image objects (vs pixels)
- ◎ Image object features (spectral, textural, spatial) and relationships
- ◎ Image object level hierarchy (sub-objects, neighboring objects, super-objects)
- ◎ OBIA classification – supervised vs. Rule-based
- ◎ Rule Set development
  - potentially transferable to other images

# Image Object Level Hierarchy

Source: eCognition Reference Book

# Study area and DATA

- ◎ 2 different urban areas
  - different urban morphology, surfaces, materials
  - testing Rule Set transferability
- ◎ Prague, Czech Republic
  - suburban / rural area – built-up, parks, forests, lakes, agricultural land
- ◎ Mandalay, Myanmar
  - central urban area –dense, perpendicular roads

# Prague, Czech Republic

# Mandalay, Myanmar

# Input DATA

## ● VHR Image WorldView-2 - Prague

Info	Band	Wavelengths	Resolution (m)
<b>Sensor: WorldView-2</b>	BLUE	450-510 nm	0.5
<b>Location: Prague</b>	GREEN	510-580 nm	0.5
<b>Acquisition: 10.9.2010</b>	RED	630-690 nm	0.5
<b>Original resolution</b>	NIR	770-895 nm	0.5
Panchromatic: 0.5m			
Multispectral: 2m			

## ● VHR Image Pléiades - Mandalay

Info	Band	Wavelengths	Resolution (m)
<b>Sensor: Pléiades-2</b>	BLUE	430-550 nm	0.5
<b>Location: Mandalay</b>	GREEN	500-620 nm	0.5
<b>Acquisition: 7.1.2014</b>	RED	590-710 nm	0.5
<b>Original resolution</b>	NIR	740-940 nm	0.5
Panchromatic: 0.5m			
Multispectral: 2m			

- ⦿ OpenStreetMap road network
  - for the respective areas (Prague, Mandalay subsets)
  - Used in segmentation
- ⦿ Landsat 8 scene
  - for the respective areas (Prague, Mandalay subsets)

# Software

- ⦿ eCognition Developer – OBIA - Rule Set development
- ⦿ ArcMap – Data management, visualisation
- ⦿ ENVI - Atmospheric correction (QUAC), Accuracy assessment

# Pre-processing

- ⦿ Atmospheric correction of the VHR images
  - QUick Atmospheric Correction – QUAC (ENVI)
- ⦿ Bit-depth conversion
  - from 16bit to 8bit
- ⦿ Geometric corrections
  - georeferencing, co-registration, spatial adjustment
- ⦿ Clipping
  - to area of interest extent

# Rule Set development

- ⦿ Developing image processing workflow for built-up density analysis
- ⦿ Using algorithms, segmentation, image analysis, classicication, refinement, post-processing, export
- ⦿ Implemented in Cognition Network Language within eCognition Developer software

## Input Data

VHR image

OSM road network

Landsat image

Sobel-edge extraction

NDVI

NDWI

BAEI (built-up index)

1st Segmentation

Algorithm: Chessboard Segmantation  
Input thematic layer: OSM road network

**Road\_segment Level (1)**

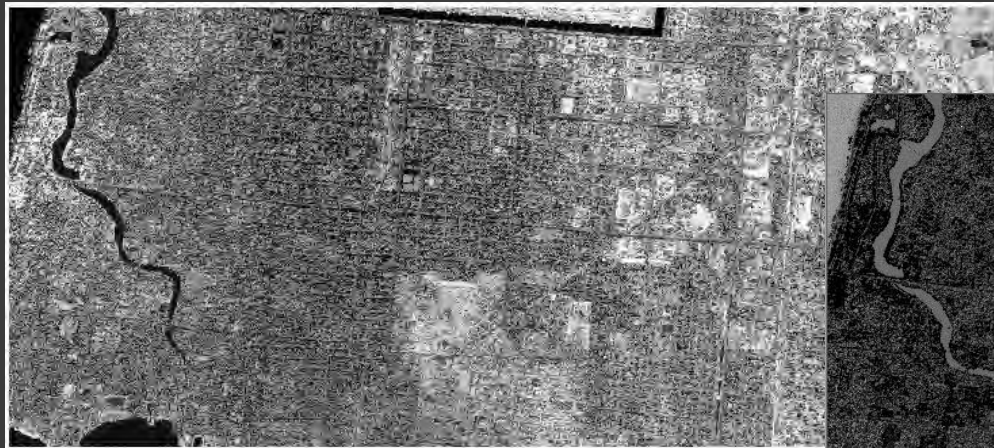

- segments of land in between road segments

2nd Segmentation

Algorithm: Multiresolution Segmentation  
Important input layers: Sobel edge, NDVI, NIR  
First land cover classification

**LC\_Analysis level (7)**

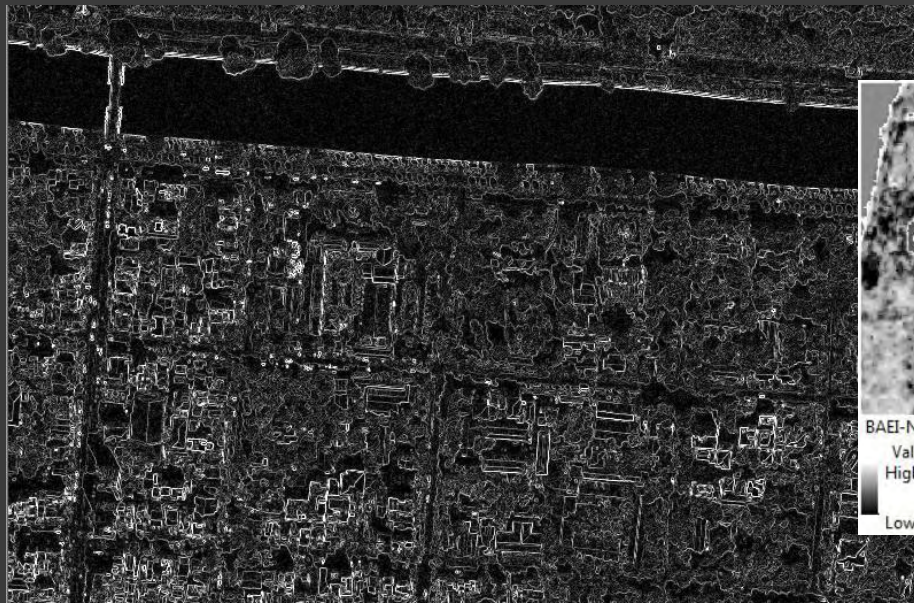

-image objects representing individual buildings or their parts  
-classes : water, swimming pools, shadows, vegetation, bare soil, built-up

NDVI

NDWI

Sobel

L8\_BAEI

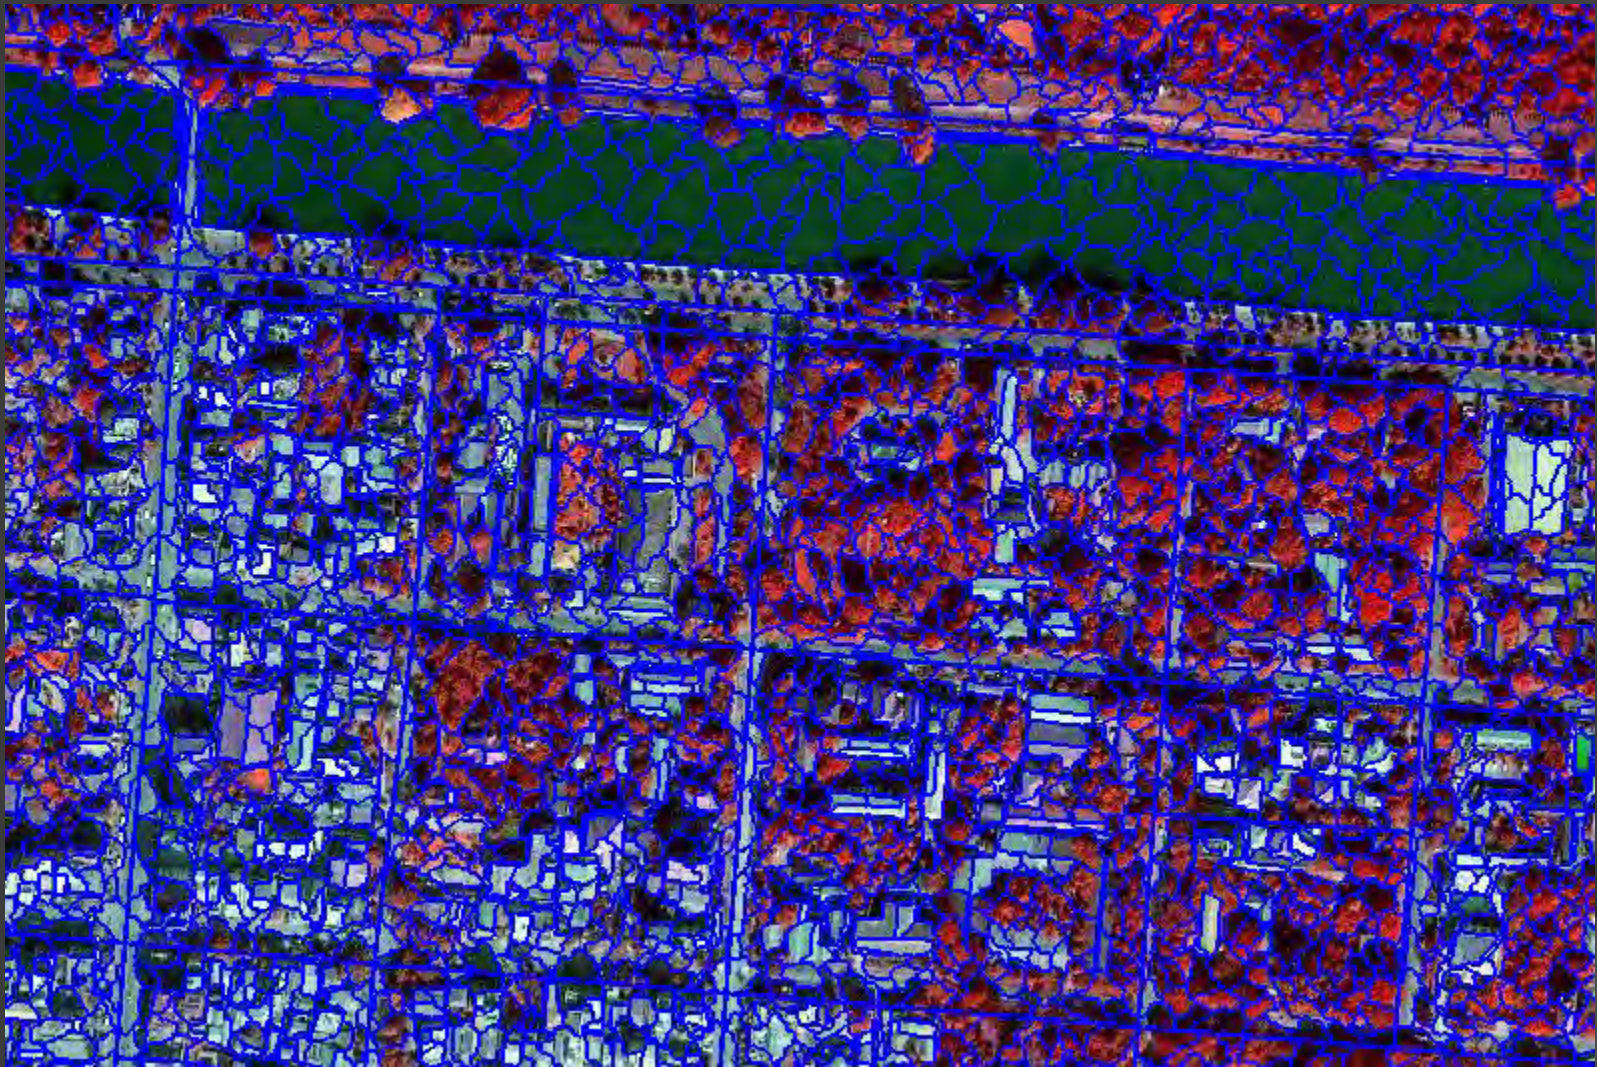

## Segmentation by road network (Chessboard segmentation)

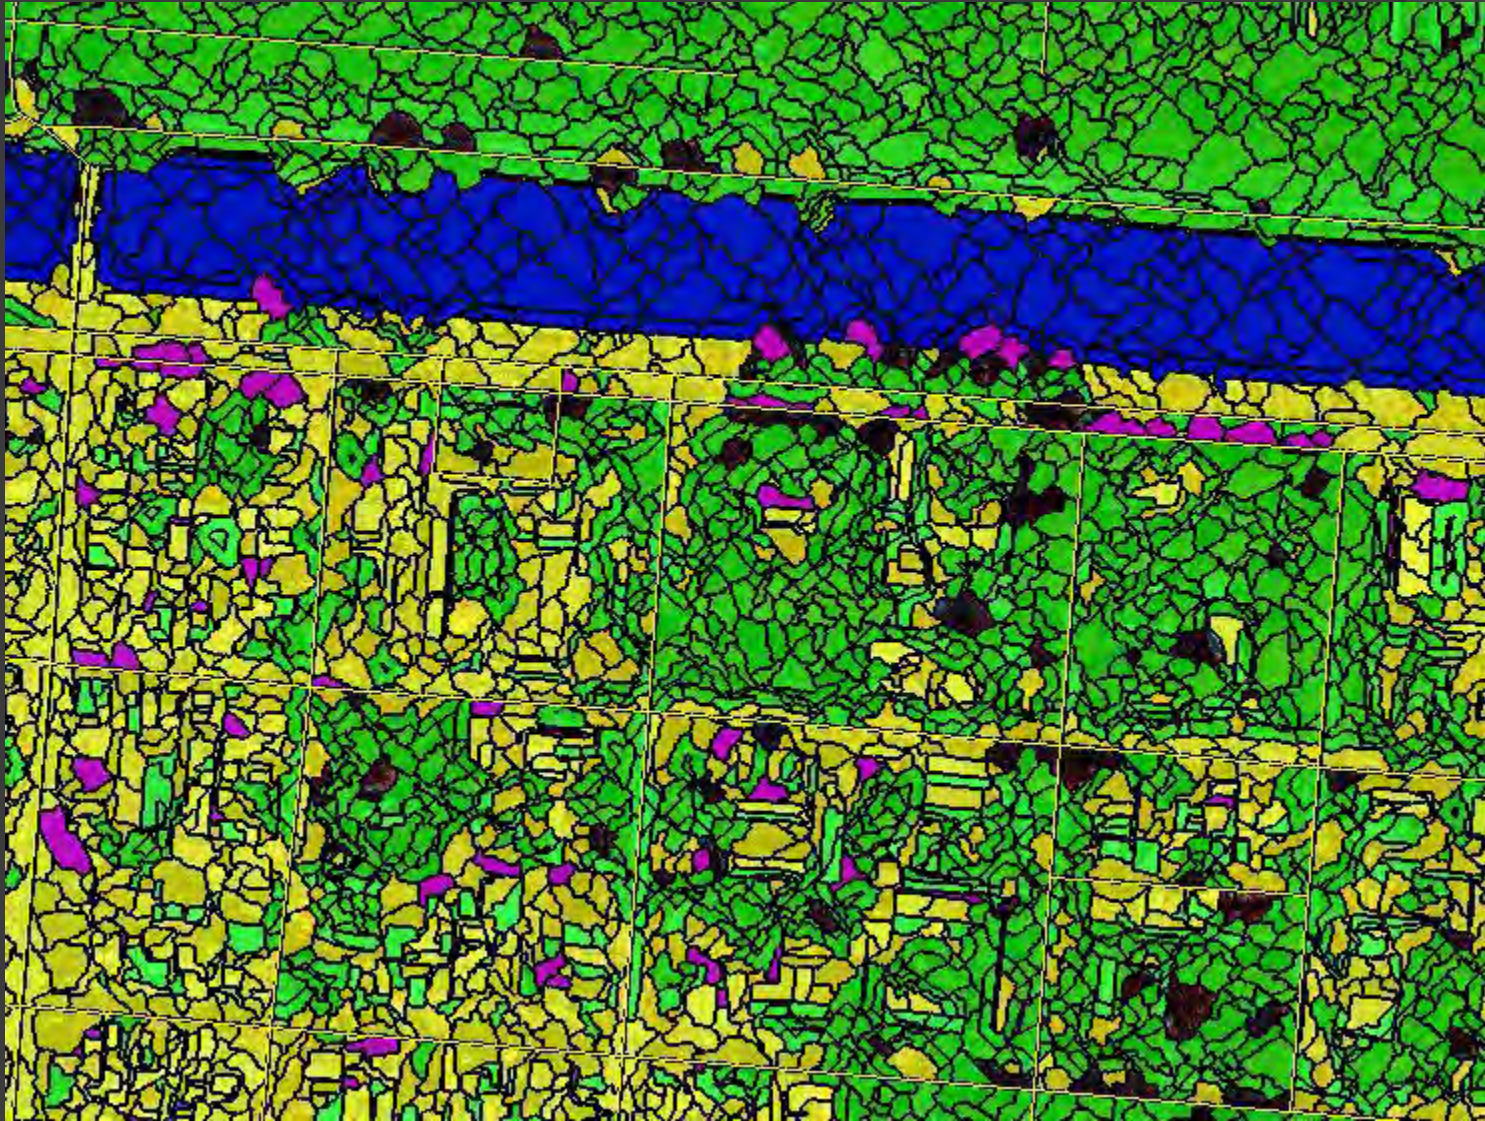

Result of first segmentation – Chessboard Segmentation on pixel level using OSM road network – creation of ROAD\_SEGMENT level

## Multiresolution segmentation – Parameters:

Scale : 20, Shape 0.8, Compacstness: 0.2

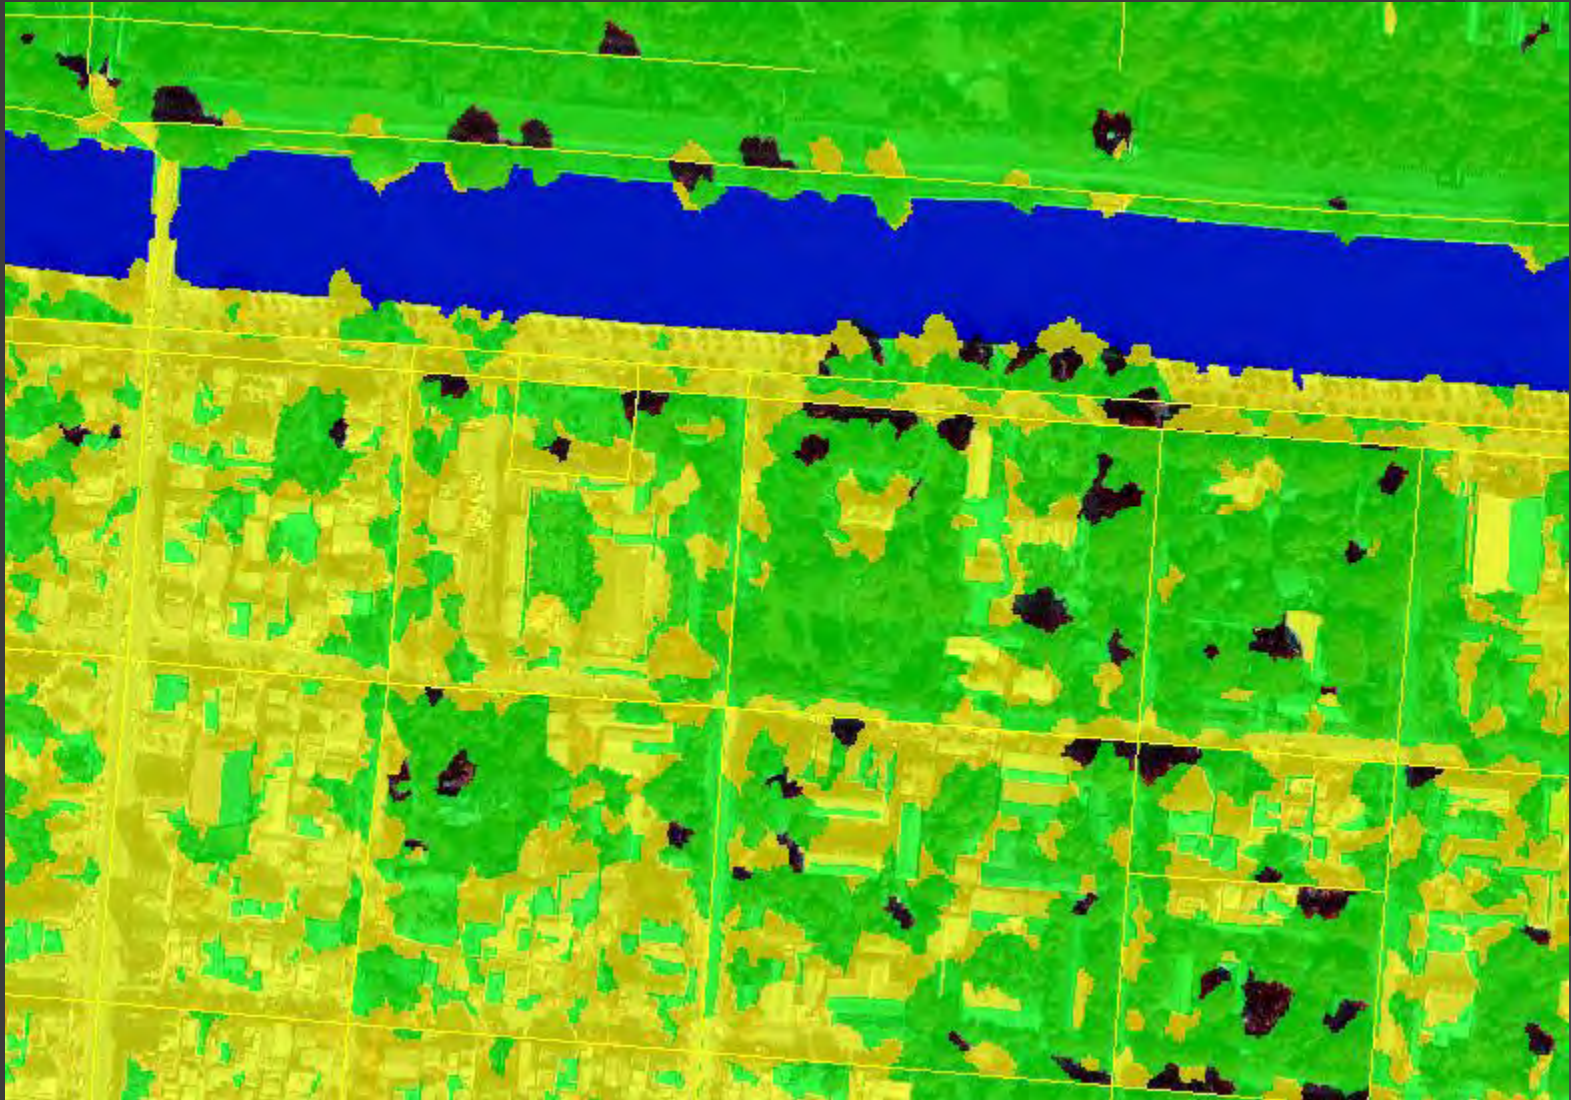

Result of Multiresolution Segmentation and creation of LC\_ANALYSIS level

Classified image objects at the LC\_ANALYSIS level  
(yellow=built-up, green=vegetation, blue=water, purple=shadow, no color=unclassified)

Class	Image object features used	
	Prague	Mandalay
Built-Up	<ul style="list-style-type: none"> <li>• <math>NDVI &lt; 0</math></li> <li>• <math>RED &gt; 70</math></li> </ul>	<ul style="list-style-type: none"> <li>• <math>NDVI &lt; 0.15</math></li> <li>• <math>RED &gt; 100</math></li> <li>• mean Sobel edge <math>&gt; 4</math></li> </ul>

## Pixel-based image object grow (dilation)

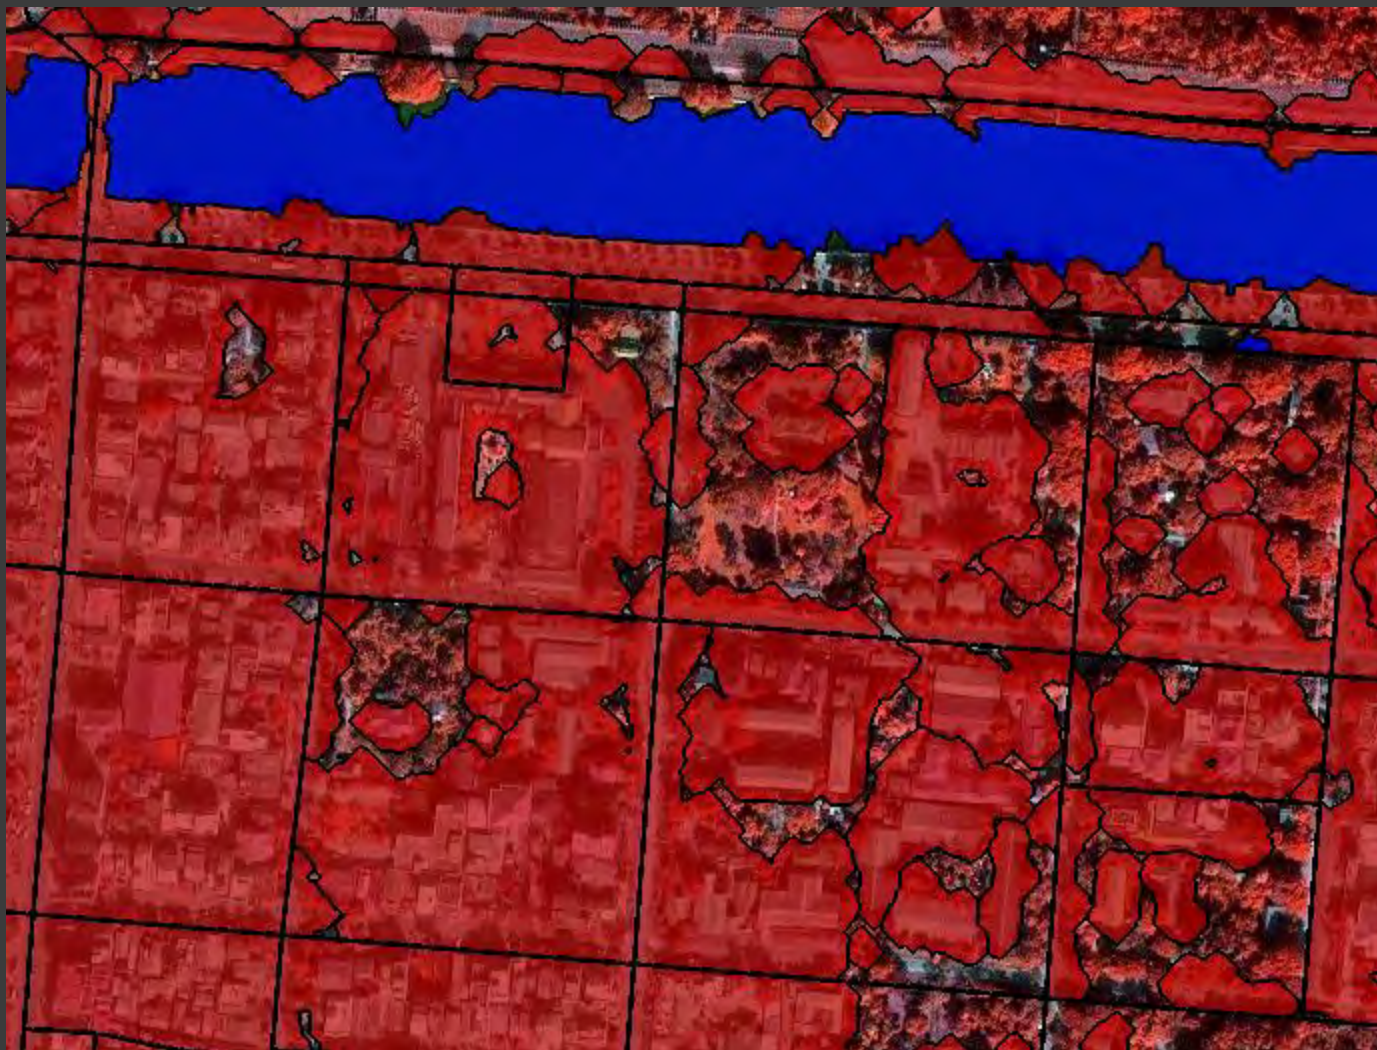

Source: <http://homepages.inf.ed.ac.uk/rbf/HIPR2/dilate.htm>

## BUILT-UP surface

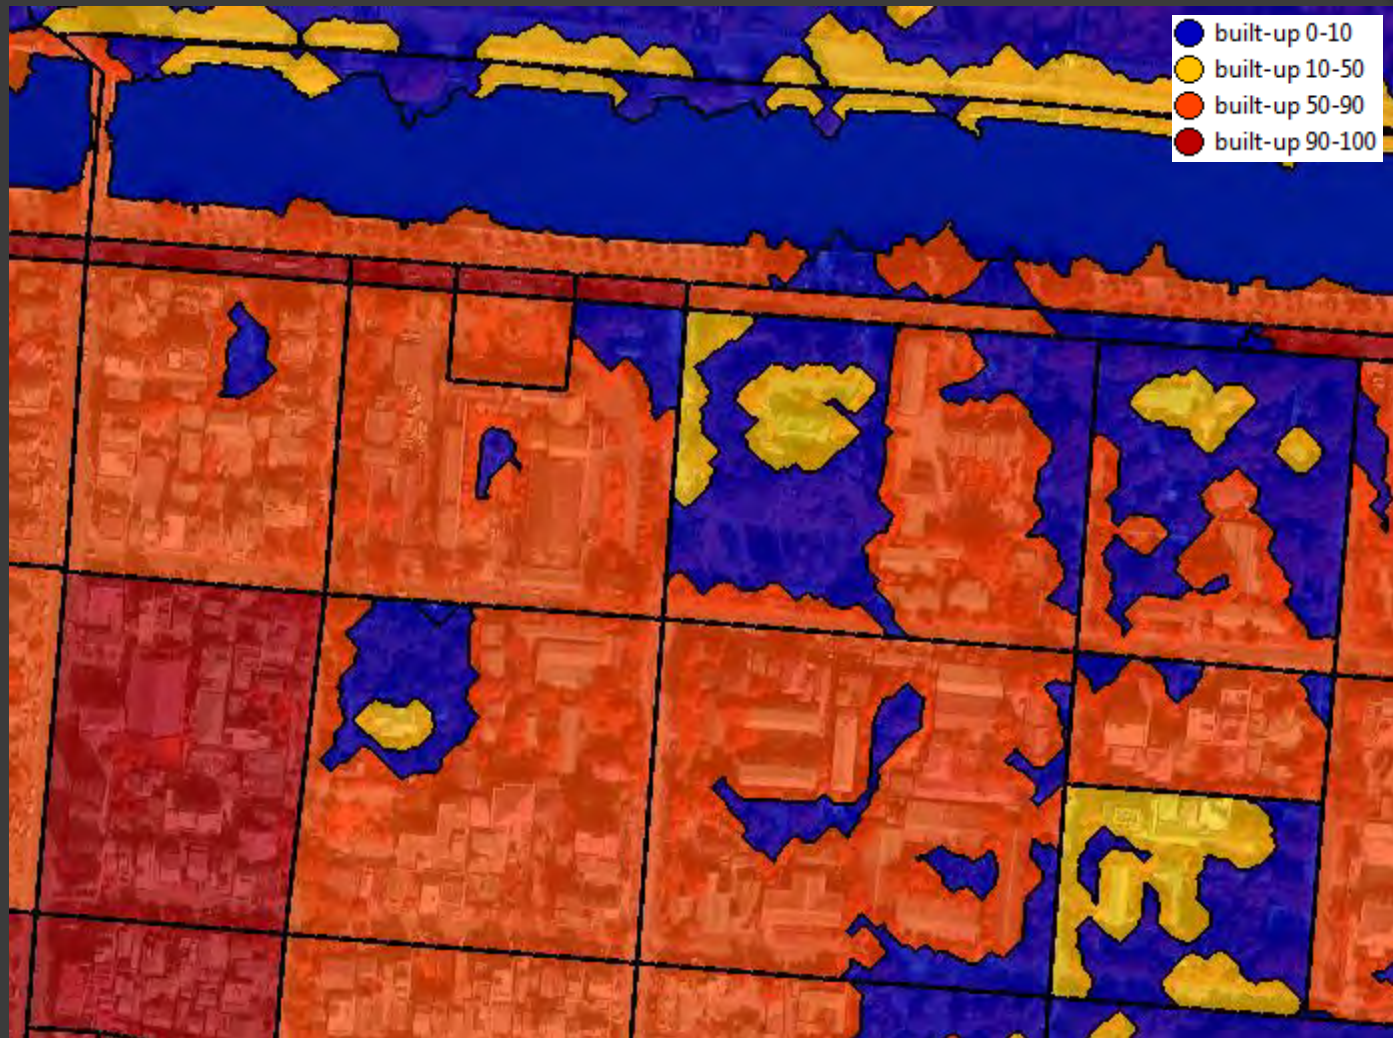

BUILT-UP level – only built-up surfaces

## 15 px grow

REFINE level – result of pixel-based object grow

## Built-up density classification

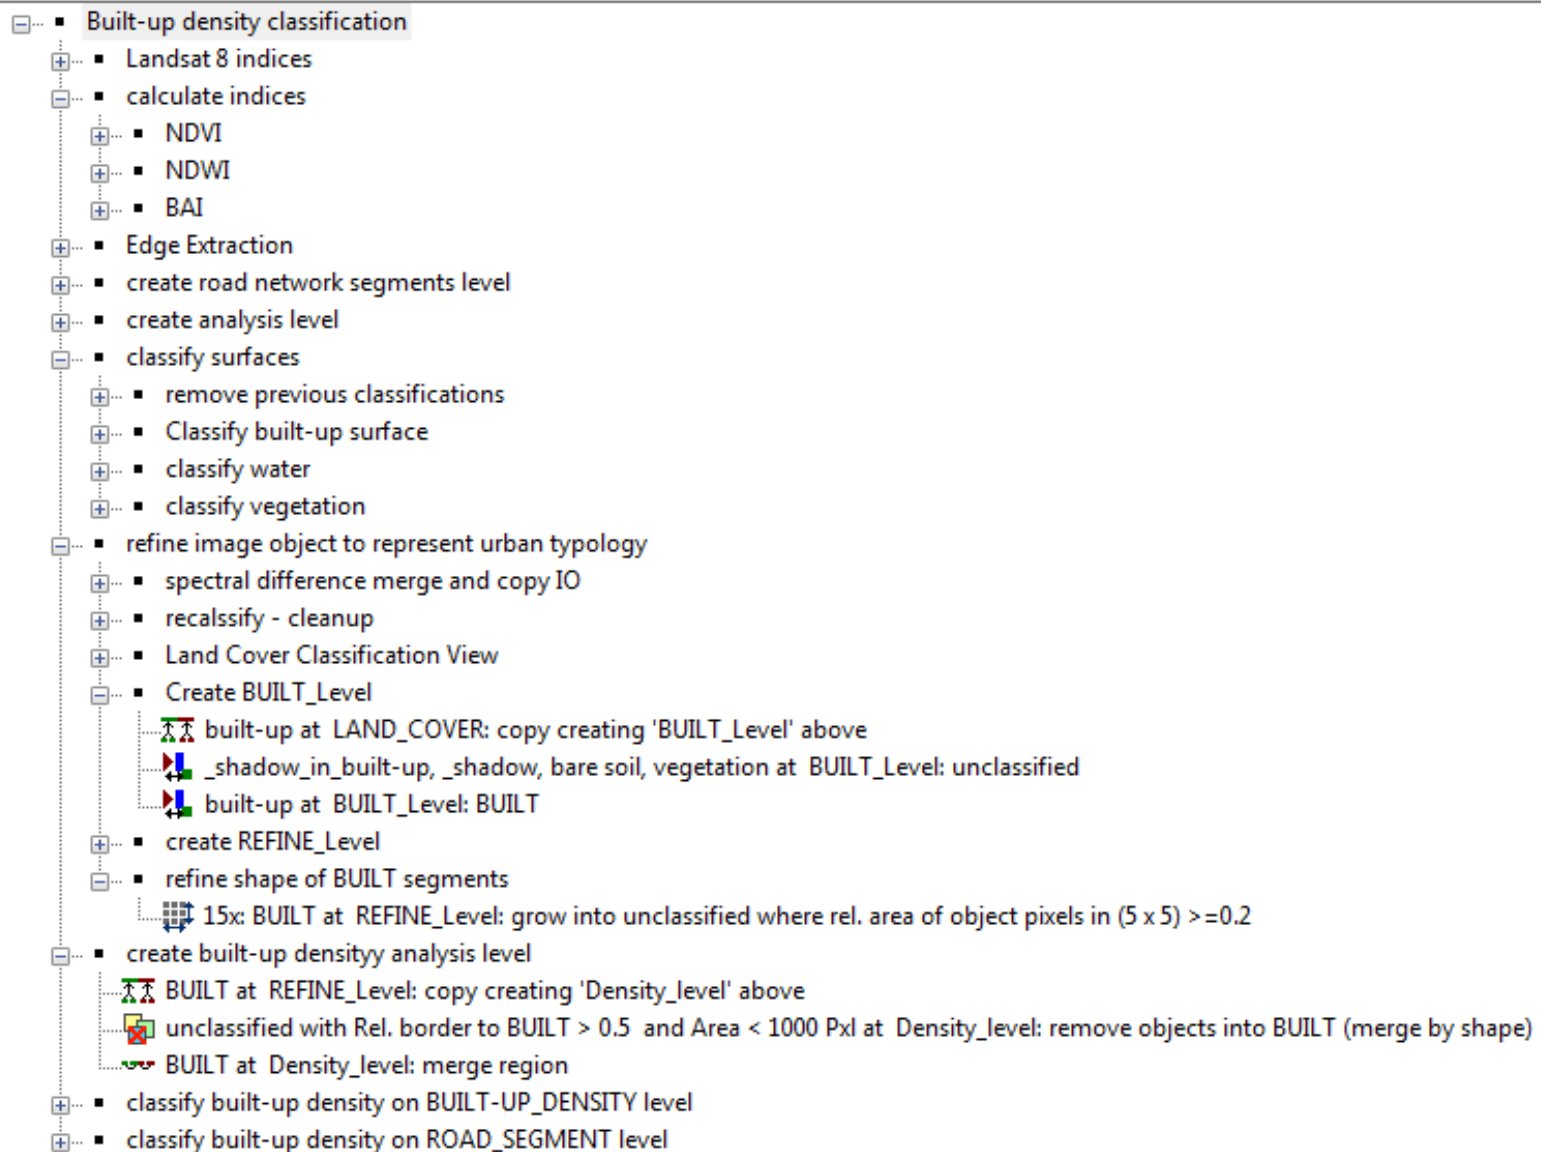

Built-up density classification on the refined extended built-up area- BUILT-UP\_DENSITY level

Image Object Level	Description
1. ROAD_SEGMENT level	Image segmented into blocks created by road network
2. BUILT-UP_DENSITY level	Level closely representing the overall shape of compact built-up area used for built-up density classification
3. REFINE level	15px buffer on built-up level – grow, generalisation, smoothing
4. BUILT-UP level	Only built- up layer
5. LAND_COVER level	Abstracted land cover – built-up, vegetation, water, bare soil
6. SPECTRAL_DIFFERENCE level	Segments representing objects with high spectral homogeneity
7. LC_ANALYSIS level	Segments closely representing individual buildings and distinct features, scale level 20

Description of the created image object level hierarchy

# Results

- ⦿ Rule Set
- ⦿ Land Cover map
  - 4 classes: built-up, vegetation, water, bare soil
- ⦿ Built-up density blocks – broader built-up area
- ⦿ Built-up density classification on 2 levels:
  - 1. ROAD\_SEGMENT level (road enclosed segments)
  - 2. BUILT-UP\_DENSITY level (refined extended built-up area)

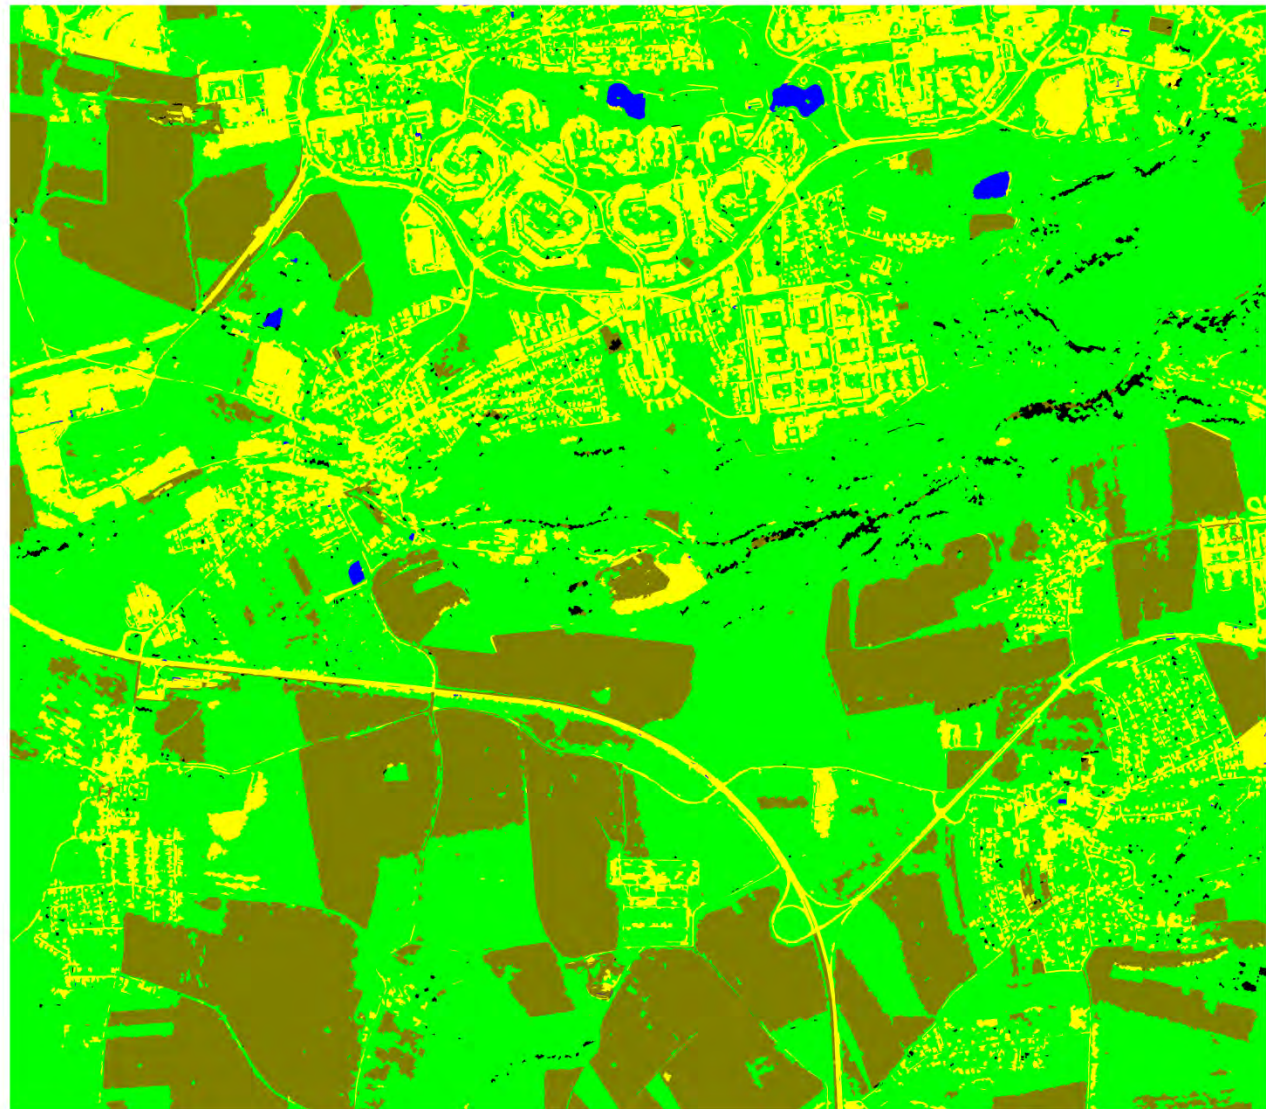

## Rule Set

# Prague - land cover

## Land cover class:

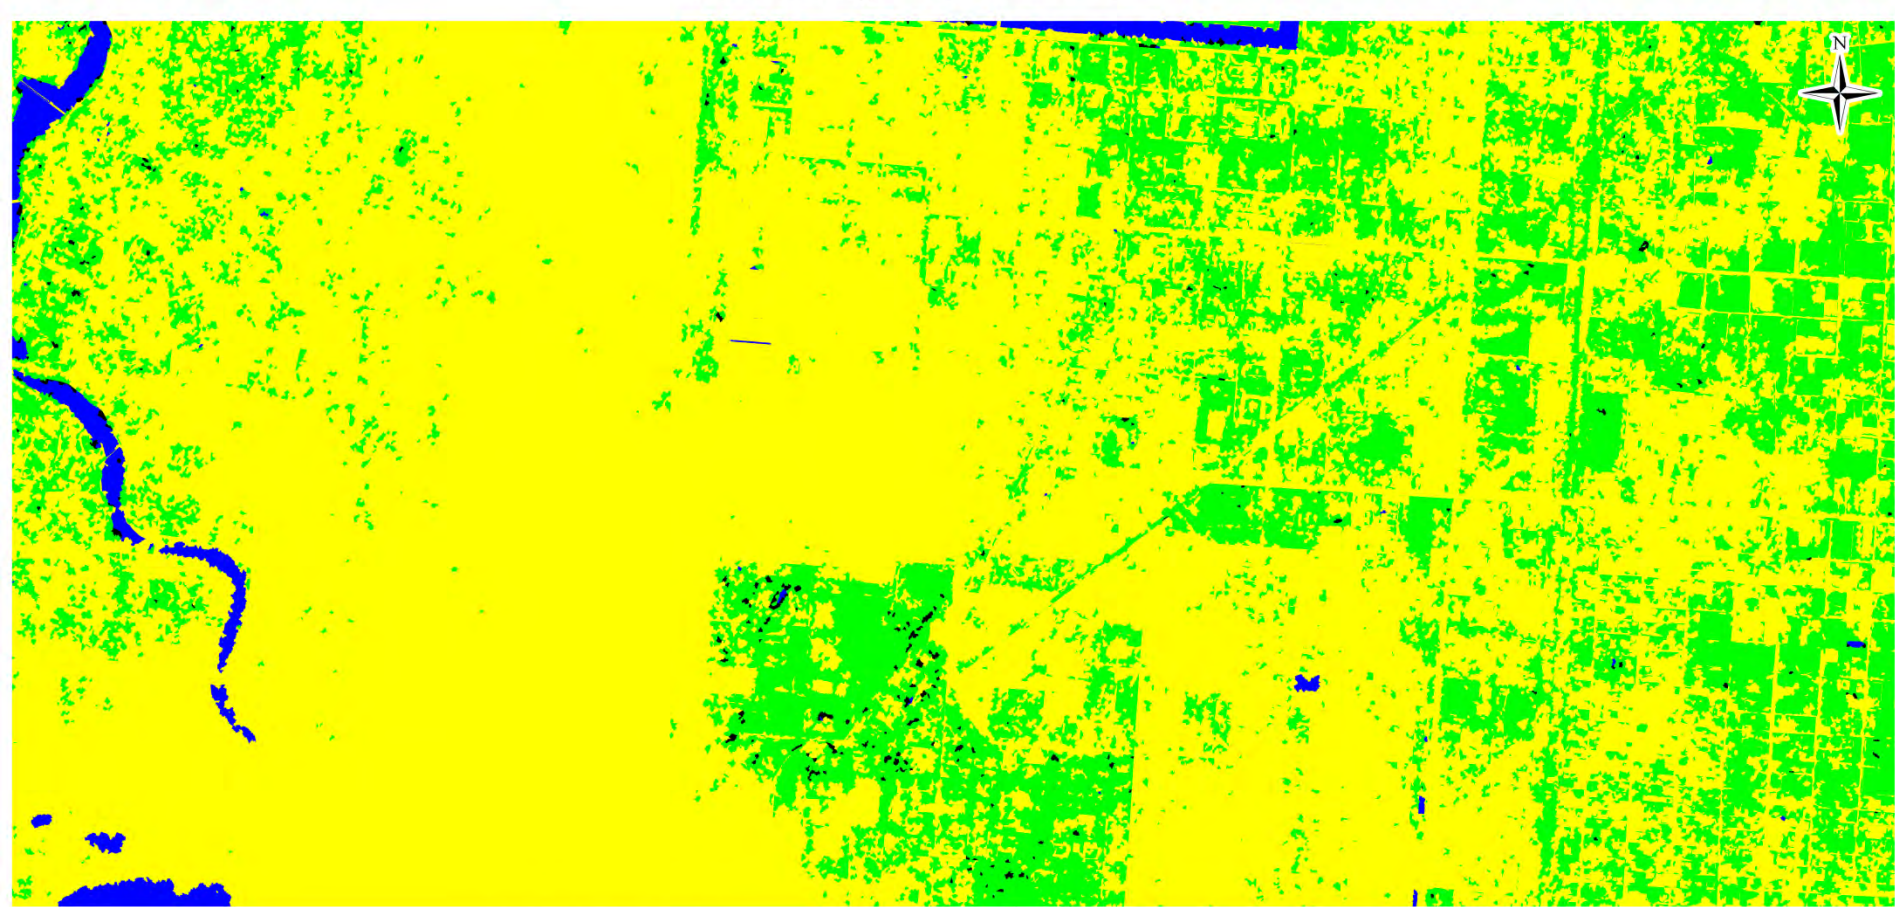

-  unclassified
-  built-up
-  vegetation
-  water
-  bare soil

confusion matrix for built-up density classification on the BUILT-UP\_DENSITY level - Mandalay

## Issue 1 - unsuccessful broader delineation of sparsely built up areas (10-50%)

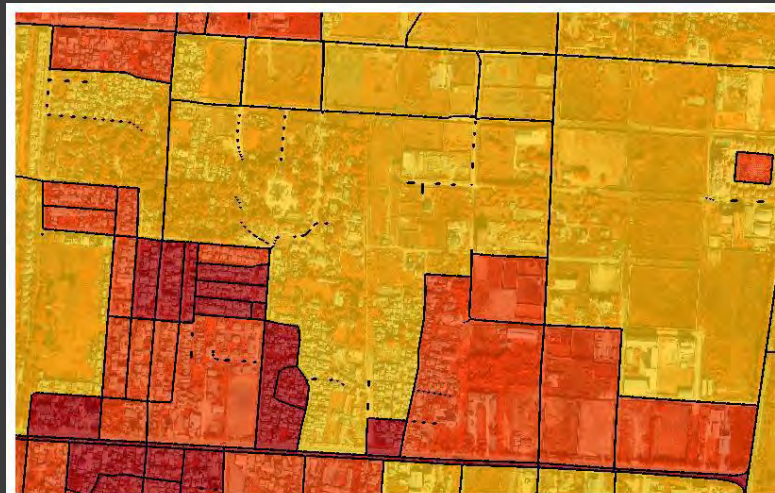

- a) original image (Yellow transparent box with black borders = built-up density reference polygon )  
b) land cover classification (yellow = built-up)  
c) built-up density classification (yellow = built-up 10-50%) on BUILT-UP\_DENSITY level

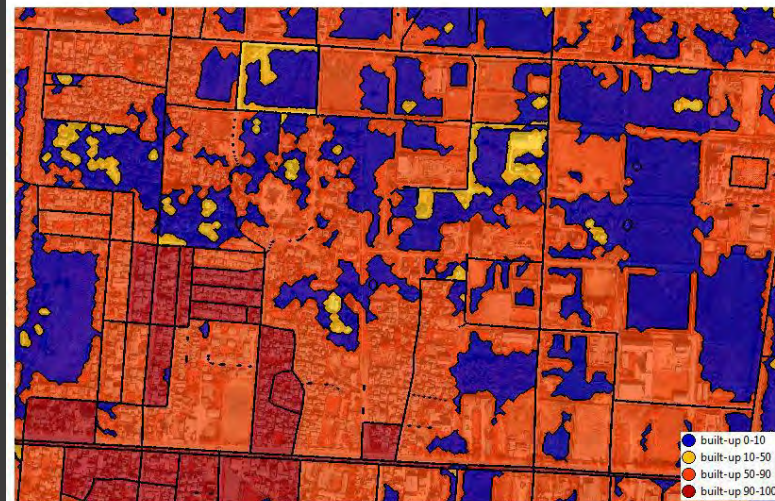

- a) original image
- b) land cover classification
- c) built-up density at ROAD\_SEGMENT level
- d) built-up density at refined BUILT-UP\_DENSITY level

a

b

- a) built-up density classification on the ROAD\_SEGMENT level
- b) built-up density classification on the BUILT-UP\_DENSITY level

# Transferability

- Rule Set was developed on a subset of Mandalay image, later tested on Prague image
- The classification part of the Rule Set was optimized for each image
- Image object refinement was uniform for both images
- The results are comparable in both images

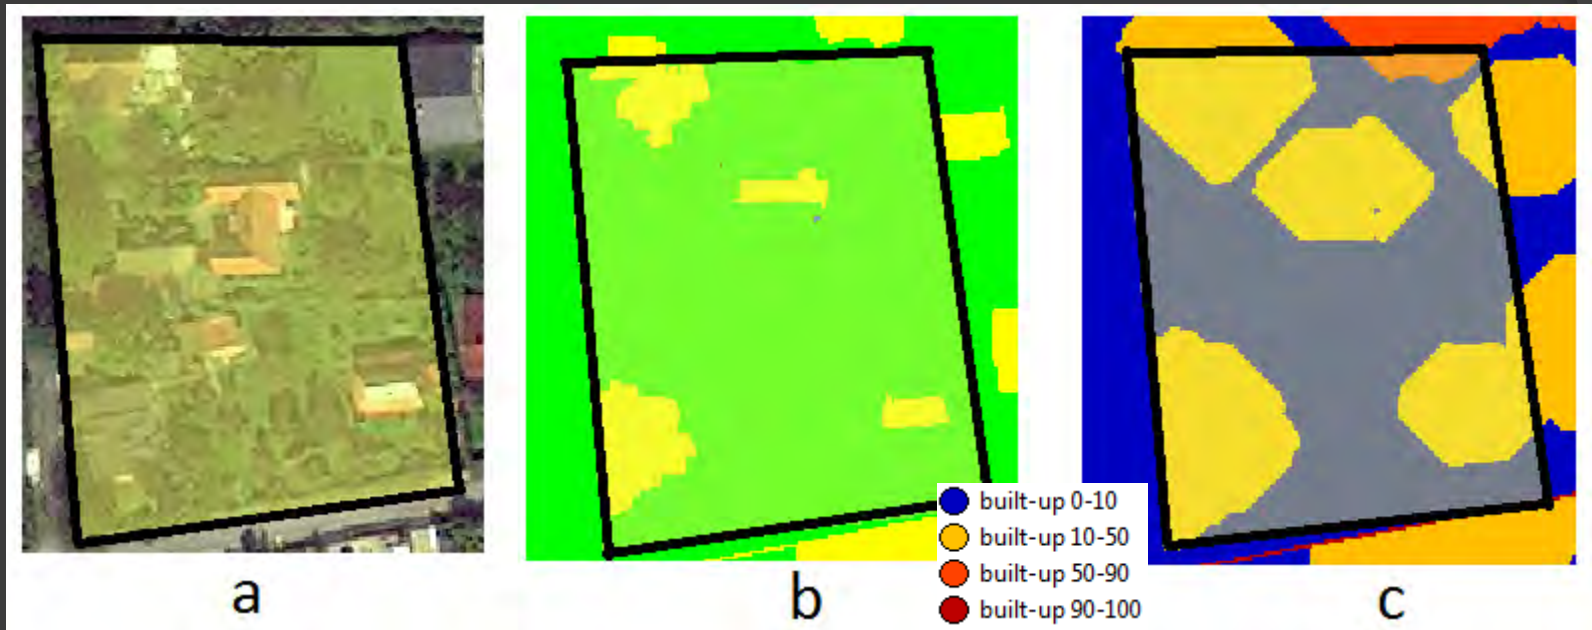

# Conclusion

- Image processing workflow was implemented
- Segmentation results were refined to represent broader built-up area – pixel based grow, shape refinement
- Built-up density was calculated
- Segments were classified into 4 built-up density classes
- Transferability was tested - classification optimization needed

# Possible improvements and future work

- Using ancillary data (DSM, SAR, vector data) to increase the accuracy of LC classification
- Obtain reliable reference data
- Implement rules for restriction of the grow algorithm only towards densely built-up areas – also deliniation of sparsely built-up areas
- Consider size, shape or color of the buildings to estimate functional use of the built-up area segment
- Classify urban typology

## Issue 1 - unsuccessful broader delineation of sparsely built up areas (10-50%)

- a) original image (Yellow transparent box with black borders = built-up density reference polygon )  
b) land cover classification (yellow = built-up)  
c) built-up density classification (yellow = built-up 10-50%) on BUILT-UP\_DENSITY level
